**TANZANIA PLANT HEALTH
AND PESTICIDES AUTHORITY**

Strengthening Plant Health Services in Tanzania for Enhanced Food Safety

(STREPHIT)

Detection survey for *Xylella fastidiosa* in the United republic of Tanzania

FOREWORD

The Tanzania Plant Health and Pesticides Authority regularly conducts surveillance of plant pests and diseases with the aim of curbing spread, mitigating damage and, whenever possible, eradication. To ascertain the country's freedom from the noxious bacteria *Xylella fastidiosa*, a national detection survey was conducted. The current report presents methods and results of the survey. As of 21st August 2023, the country is declared to be free from *Xylella fastidiosa*. To maintain the status, the NPPO will conduct regular qPCR testing of incoming consignments of plant materials for planting of hosts that are susceptible to the bacteria.

The survey was done with the support of the Food and Agriculture Organization (FAO) through the project "Strengthening Plant Health Services in Tanzania for Enhanced Food Safety (STREPHIT)". The project is funded by the European Union along with contributions from FAO and the Government of the United Republic of Tanzania.

i. Survey design:

The survey was conducted countrywide in different agro-ecological zones (blocks) with sampling focusing on main hosts (of trade importance and natural habitat) and abundant vectors of the pest present in the locale. The zones are defined in the map below (Figure 1).

Figure 1 Agroecological blocks for *Xylella fastidiosa* survey

Target hosts from which samples were drawn per agroecological zone is depicted in table below:

Zone	Commercial (Exports to the EU)	Other main hosts
Northern zone	Avocado, Coffee, Chrysanthemum flowers	Citrus spp.
Lake zone	Avocado, Coffee	Citrus spp.
Central zone	Tobacco	Citrus spp.
Coastal zone	Solanaceae family (Tomato, eggplant)	Citrus spp.
Southern highlands	Avocado, Coffee, Tobacco	Citrus spp.

Other hosts considered were extracted from the EFSA (European Food Safety Authority) host database for *Xylella fastidiosa*.

ii. Sampling design

The design is meant to achieve a confidence level of 95% with key detection method being qPCR. Since host population size per agro-ecological zone is not documented, selection of sampling sites was random, depending on pre-analysis. Since *Xylella fastidiosa* is not known to occur, the design prevalence for this survey was 1%.

The inspection units were the host plants and were evaluated per 2 ha per district. In each district, random fields with host plants were sampled accordingly. This included agricultural areas, forest areas and urban areas.

In districts with more than three fields of a specific host plant, not less than 50m apart, of less than or equal to 2 ha, three fields were inspected. If less than three fields were available, all existing fields of the respective hosts were inspected, regardless of the size. For commercial production sites for export markets, all were inspected and given a traceability code. A database with status of *Xylella fastidiosa* for these sites was developed.

Sampling in fields of ≤ 2 ha followed a “W” pattern with 7 stations where 5 samples of the host plant were collected per station (35 samples per 2 ha). Fields with more than 2ha were divided into 2ha blocks and each block was sampled using the same pattern. The sampling effectiveness for this method deployed is **0.70**.

Figure 2 Scouting trek

iii. Sampling

Sample collection was in accordance with ISPM 27, Annex 25 (DP25 – *Xylella fastidiosa*). Plant part target were the midribs and petioles. Number/weight of leaves per sample will was 5/0.5-1g for large leaves, 25/0.5-1g for small leaves with petioles and midribs; 25/0.5-1g for species without petioles/midribs. For dormant or plant cuttings, the xylem tissue was sampled. Samples were stored in microfuge tubes kept in cold conditions (4°C) before freezing in -20°C at the laboratory.

iv. Data collection

All samples were georeferenced. Data included Region, District, GPS Coordinates, Host plant, Sample type (plant part sampled), Sample ID and lab result. This data was collected using *KoboToolBox*. The web form versions were shared with lab analysts for recording of lab results (Enketo web form) for each sample. Data collection tool (enketo form) can be accessed via link below:

Toolkit 1: <https://ee.humanitarianresponse.info/x/IMHOLh0H>

v. Molecular diagnosis

Molecular analysis was conducted in accordance to ISPM 27 Annex 25, using the protocol for DNA extraction and Real time PCR provided (Li et al, 2013)¹. The analysis was done at the Tanzania Agriculture Research Institutes Molecular Biology Laboratory in Mikocheni, Dar es Salaam.

vi. Workplan

1. The experts met in Arusha for 5 days where they:
 - i. Developed a Work Plan and a Questionnaire for conducting the surveillance and sampling protocol
 - ii. Trained on how to use the Kobo Collect Mobile App for collection of intended information
2. The team of expert was divided in 4 groups where they will conduct the surveillance by collecting the samples and the intended information in their designated regions for 14 days
3. Samples were submitted to the lab for lab diagnostics for 5 days
4. The team of experts reconvened in Arusha for 4 days to compile the report and submit to the EU

RESULTS

Population size: 767,704

Number of samples inspected: 313,348

Number of samples collected : 3,155

Potential hosts sampled: Coffee, Grapes, Tomato, Avocado, Flowers, Eggplant, Sweet oranges, Tangerine

Coverage:

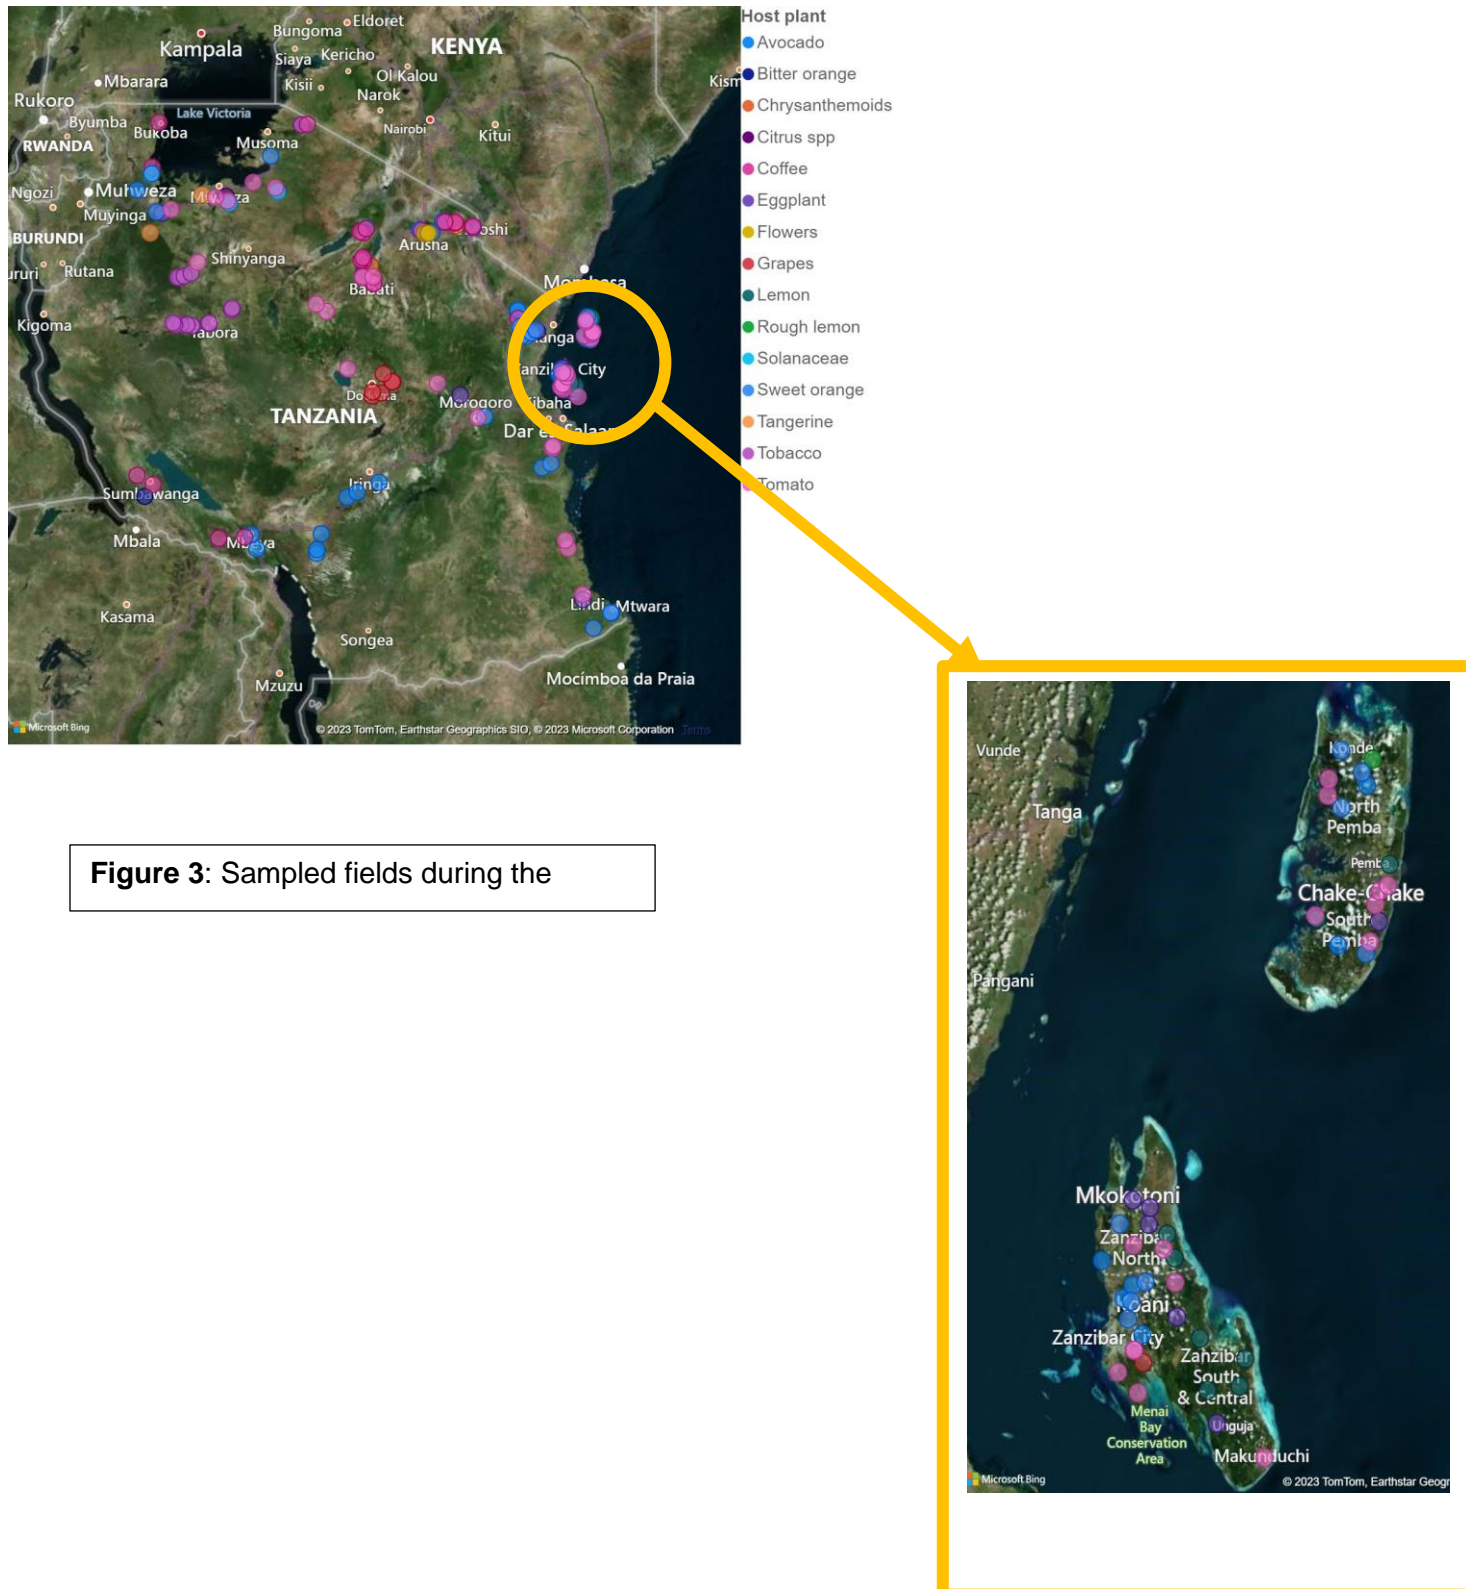

Image plate 1: Plants in the field considered for sampling and transportation to the laboratory for molecular diagnosis

qPCR results

All analyzed samples were found to be negative
