### ENDORSEMENT

This standard was endorsed by the Interim Commission on Phytosanitary Measures in November 1998.

#### INTRODUCTION

#### SCOPE

This standard describes the components of a pest eradication programme which can lead to the establishment or reestablishment of pest absence in an area.

### DEFINITIONS

Definitions of phytosanitary terms used in the present standard can be found. Used No. 5 *Glossary of phytosanitary terms*). The term and definition below were adopted as part of the resent A. M. but are amended subsequent to adoption of the standard. The new definition of this term does not co form to the per the term in the present ISPM, and this term and definition are retained for the purpose of the pesent andard only, will it has been revised.

outbreak

An isolated pest population control ected and expected to survive for the immediate future.

ome.

# **OUTLINE OF REQUIREMENTS**

A programme for pest eradication may be devioped by a National Plant Protection Organization (NPPO) as:

- an emergency measure to prevent establishmer. Also pread of a pest following its recent entry (re-establish a pest free area), or
- a measure to eliminate an est bished pest (establish a pest free area).

After a preliminary invest ion that includes consideration of data collected at the site(s) of detection or occurrence, the extent of infesta i, information on the biology and potential economic impact of the pest, current technology and available for eradication, a cost-benefit analysis of the pest eradication programme should be undertaken. Whene it is also seful to gather information concerning the geographical origin of the pest, ossi risk analysis (PRA) provides a scientific basis for informed decision-making and pathways for oduc (see ISPM No sk analysis). From these studies, one or more options should be made available to : Guide les for pe mergency situation, the benefits of speed of action in preventing spread may outweigh decision-mak Ho the benefits nor achieved through a more structured approach.

The eradication proces involves three main activities: surveillance, containment, and treatment and/or control measures.

When an eradication programme is completed, the absence of the pest must be verified. The verification procedure should use criteria established at the beginning of the programme and should be supported by adequate documentation of programme activities and results. The verification stage is integral to the programme, and should involve independent analysis if trading partners require this reassurance. Successful programmes result in a declaration of eradication by the NPPO. When unsuccessful, all aspects of the programme should be reviewed, including the biology of the pest to determine if new information is available, and the cost-benefit of the programme.

## GENERAL REQUIREMENTS FOR PEST ERADICATION PROGRAMMES

This standard provides guidance on the development of a pest eradication programme and for reviewing the procedures of an existing eradication programme. In most instances, the pests considered for these programmes have newly entered the area where eradication is undertaken, and emergency eradication measures may be needed. However, eradication programmes may also be directed toward established exotic pests or indigenous pests in defined areas.

### 1. General Information and Planning Processes

### **1.1** Evaluation of pest reports

NPPOs should systematically evaluate pest reports and the impact of these pests to determine if eradication is required. This evaluation will involve reporting to an official contact point and assessment by experts capable of considering the importance of the pest report and of recommending a course of action.

### **1.2** Contingency plans

It is desirable to have contingency plans to address specific pests or pest groups that a high potential for e pest is found in introduction, and for which an eradication plan is deemed to be both feasible and necess befo an area. The development of such plans is advantageous because it provides additiona me for delib tion, evaluation and research necessary to ensure that an eradication programme is well designed a an be exec ed quickly and y allow for the effectively. Such plans are particularly important where cooperative programm ated, as are and actions of cooperating parties to be specified and agreed upon prior to impler ting the pros nowledge gained from previous successful eradication programmes can be extremely useful r devel ig conth ncy plans or judging the feasibility of eradication programmes under consideration. A general consideration plan is also particularly useful for ensuring rapid action in the case of emergency eradication measures.

It should be recognized that the biology of pests varies considerably as do the technologies available for eradication. Therefore, not all the factors listed in this standard for construction of value in planning every eradication programme.

### 1.3 Reporting requirements and information sharing

Verification of the occurrence of a new pest of immediate or potenal danger initiates the process that leads to reporting requirements for the NPPO under the International and Protectic Convention (see New Revised Text: Article VII 2j and Article VIII 1a and 1c) and is described in the ISF No. 8: Extermination of pest status in an area.

Prior to the implementation of a perturbidication pogramme, public information programmes or other means for sharing information with broader audienties such a proven residents, and local governments, should be considered for raising the level of awareness and understanding of the providence.

## 2. Decision to Undersake 20 Cradication Programme

ogramme results from an evaluation of the circumstances of detection of a The decision to und dication ke an pest, its identify by a pest-initiated PRA, estimation of the present and potential distribution of risk i nty of conducting an eradication programme. It is normally good practice to give the pest, and f the feas essmen ments recommended. However, this approach may be limited in practice by the due conside nd resources. Particularly in cases where emergency eradication measures seem necessary (e.g. availability of capable of rapid dispersal), the need to take action rapidly should be carefully balanced and may recent entry of a nore detailed analyses and planning. outweigh the benefits

## 2.1 Initiation

The eradication programme may be initiated by detection of a new pest arising from general surveillance or specific surveys (see ISPM No. 6: Guidelines for surveillance). In the case of established pests, the eradication programme will be initiated by policy considerations (e.g. a decision taken to establish a pest free area).

#### 2.2 Identification

Accurate identification of the pest is essential so that the appropriate means of eradication can be selected. NPPOs should proceed with the identification process recognizing that it may have to withstand scientific or legal challenge. Therefore, it may be appropriate to have the identification confirmed by acknowledged independent experts.

Identification may be immediate when the pest is easily and confidently recognized by the NPPO.

Identification methods may range from recognition based only on morphological characteristics to more sophisticated bioassay, chemical or genetic analyses. The method ultimately adopted by the NPPO will depend on the organism in question and the most widely accepted and practical means to confirm identification.

In cases where a conclusive identification is not immediately possible, the actions to be taken may be justified by other factors such as the extent of damage to host plants. In these circumstances it is important to conserve specimens for possible future analysis.

### 2.3 Estimating present and potential pest distribution

An estimate of the present distribution of the pest is necessary for both new and established pests. The potential distribution is usually of greater importance for new pests, but may have relevance as well in evaluating established pests. The data elements identified for initial investigation include a level of detail not necessarily required for a programme directed toward established pests.

### 2.3.1 Initial investigation

Data associated with the detection of a new pest, the geographical origin of the pest and the athway, should be compiled and reviewed. This information is not only useful for decision-making related peradication, ut is also helpful for identifying and correcting weaknesses in pest exclusion systems that may have contributed to the entry of the pest.

### 2.3.1.1 Data gathered at the site of detection or occurrence

Information should be gathered concerning the pest and conditions at the size of detection or occurrence, including:

- geographical location
- hosts infested at the site
- extent and impact of damage and level of pest prevalence
- how the pest was detected and identified
- recent imports of plants or plant products
- history of the pest on the property or in the area
- movement of people, products, equipment, gavey
- mechanism of spread within the area
- climatic and soil conditions
- condition of infested plants
- cultivation practices.

## 2.3.1.2 Geographical origin

To the extent possible, information should pabla red on the country or area most likely to be the origin of the pest. Information concerning courses of re-export or to be it may also be considered when attempting to determine the source and pathway.

#### 2.3.1.3 Pathways of the pes

To the extent possible, e NPP should determine the pathways by which the pest may have entered or spread, to ensure that endication, ogrammes are not jeopardized by new pest entries, and to help identify potential exclusion options. Pathway information obtained by the commodities or items that may have carried the pest as well as the possible mode of a wement. Where there is a possible association with newly imported plants or plant products, similar material should be a fited and examined.

## 2.3.2 Survey for distribution

The preliminary processes should provide sufficient information to determine if a survey is required.

Surveys may be of various types:

- delimiting survey at each outbreak
- survey based on pathway studies
- other targeted surveys.

These surveys should be designed and executed to provide the level of statistical confidence necessary for the results to be meaningful for regulatory purposes.

In cases where survey data are to provide the basis for establishing a pest free area for export purposes, it may be desirable to consult trading partners in advance to determine the quantity and quality of data necessary to meet their phytosanitary requirements.

## 2.3.3 Predicting spread

Data collected during a preliminary investigation should be used to estimate the potential for spread and the anticipated rate of spread, and to identify endangered areas.

### 2.4 Feasibility of undertaking an eradication programme

An estimate of the impact and extent of the infestation, the potential for spread, and the anticipated rate of spread is necessary to judge the feasibility of an eradication programme. PRA provides a scientific basis for this estimate (see ISPM No. 2: Guidelines for pest risk analysis). Possible eradication options and cost-benefit factors should also be considered.

## 2.4.1 Biological and economic information

Information needs to be obtained on:

- pest biology
- potential hosts
- potential spread and anticipated rate of spread
- possible eradication strategies:
  - financial and resource costs
    - availability of the technology
  - logistical and operational limitations
  - impact on industry and the environment:
  - without eradication
  - with each eradication option identified.

# 2.4.2 Conducting cost-benefit analysis for eradication pagram

One of the first actions to be taken is the preparation of a list of a grast reast condication techn and the cost-benefit ratio for each strategy should be accurated on the short and long term. The action, or to take a pest management approach, should be considered as full as eradication options.

All feasible options should be described or discuss at with decision makers. Anticipated advantages and disadvantages, including cost-benefit should be outlined in the attent possible. One or more options should be recommended, recognizing that the ultimate decision requires consideration the technical options, cost-benefit, the availability of resources, and political and socio-economic factors.

#### 3. Eradication Process

The eradication process involves the establishment of a management team followed by the conduct of the eradication programme, which should where ossible, follow an established plan. Three main activities are included in the programme:

- surveillar fully has stigatence distribution of the pest
- containment: to revent here ead of the pest
- tree ent: to endicate the pest when it is found.

Direction and continuation should be provided by a management authority (normally the NPPO), ensuring that criteria are established to a prime when eradication has been achieved and that appropriate documentation and process controls exist to provide sufficient confidence in the results. It may be necessary to consult with trading partners over some aspects of the eradication process.

## 3.1 Establishment of a management team

A management team is established to provide direction and coordination to eradication activities once it has been decided to undertake an eradication programme. The size of the management team will vary depending on the scope of the programme and the resources available to the NPPO. Large programmes may require a steering committee or an advisory group including the various interest groups that may be affected. Where a programme includes several countries, a regional steering committee should be considered.

The management team should have responsibility for:

- ensuring that the eradication programme meets the agreed criteria for successful eradication
- formulating, implementing, and modifying as necessary an eradication plan
- ensuring programme operators have appropriate authority and training to undertake their duties
- financial and resource management

- appointing and defining duties of operators, ensuring operators understand their responsibilities, and documenting their activities
- managing communication, including a public relations programme
- communicating with affected parties, e.g. growers, traders, other government departments and non-governmental organizations
- implementing an information management system, including programme documentation and appropriate record-keeping
- daily management of the programme
- continuous monitoring and evaluation of critical elements
- periodic overall programme review.

### **3.2** Conducting the eradication programme

### 3.2.1 Surveillance

A delimiting survey should be completed either initially or to confirm earlier surveys. Monitoring surveys should then continue in accordance with the eradication plan to check the distribution of the pest and assess the effectiveness of the eradication programme (see ISPM No 6: Guidelines for surveillance). Surveillance may i success the analysis to identify the source of the pest and its possible spread, the inspection of clonally ad/or contact linked material, inspection, trapping, and aerial observation. This may also include targeted inquiries agrowers, these responsible for storage and handling facilities, and the public.

## 3.2.2 Containment

The NPPO should define a quarantine area using surveillance information initial investigations will provide information that is used to identify plants, plant products, or other at cles wh moveme out of the quarantine area needs to be regulated to prevent the spread of the pest. Owners of a products and other regulated ected plan pla articles should be notified of the regulations. Others interested hs should also be provided with or aff ted by regul adequate information. It may be appropriate to verify compliant cribed in the eradication plan.

Arrangements should be made for the release of place, practiced or other regulated articles from the quarantine area, by clearance following verification of complence with phosanically measures such as inspection, treatment or destruction. Provision should be made for the windrawal of relations when an eradication programme has been declared to be successful.

## 3.2.3 Treatment and/or control measures

Methods to eradicate pests may incl

- host destruction
- disinfestation of equipment and facilities
- chemical or biological pesticate treatment
- soil sterilants
- leaving land follow
- host-free period
- the velof cultivers that surfacess or eliminate pest populations
- restriction of const cropping
- trapping loss or other physical control methods
- inundative lease of biological control agents
- use of sterile vect technique
- processing or consumption of infested crop.

In most cases, eradication will involve the use of more than one treatment option. The selection of treatment and/or control options may be limited by legislative restrictions or other factors. In such situations, exceptions for emergency or limited use may be available to the NPPO.

## **3.3** Verification of pest eradication

This involves verification by the management authority (normally the NPPO) that the criteria for successful pest eradication established at the beginning of the programme have been achieved. The criteria may specify the intensity of the detection method and how long the survey must continue to verify the absence of the pest. The minimum period of time of pest freedom to verify eradication will vary according to the biology of the pest, but should take into consideration factors such as:

- sensitivity of detection technology
- ease of detection

- life cycle of the pest
- climatic effects
- efficacy of treatment.

The eradication plan should specify the criteria for a declaration of eradication and steps for the withdrawal of regulations.

#### 3.4 Documentation

NPPOs should ensure that records are kept of information supporting all stages of the eradication process. It is essential that NPPOs maintain such documentation in case trading partners request information to support claims of pest freedom.

### **3.5** Declaration of eradication

A declaration of eradication by the NPPO follows the completion of a successful eradication programme. The status of the pest in the area is then **'absent: pest eradicated'** (see ISPM No. 8: *Determination of pest status in an area*). It involves communication with affected and interested parties, as well as appropriate authorities concerning the fulfilment of programme objectives. Programme documentation and other relevant evidence support g une claration should be made available to other NPPOs upon request.

#### 4. Programme Review

Throughout the eradication, the programme should be subject to periodic ordew to analy and assess information gathered, to check that objectives are being achieved, and/or to determine changes be require Reviews should take place at:

- any time when unforeseen circumstances are encountered tha could af
- pre-set intervals
- the termination of the programme.

Where the criteria for eradication are not met, the eradication plan bould be reviewed. This review should take into account any newly gained knowledge that might have contrained to that result. Cost-benefit factors and operational details should be reviewed to identify inconsistencies with in all predictions. Depending on the outcome, a new eradication plan may be developed or altered to become a pest suppression or pest management programme.
