

The International Plant Protection Convention

The IPPC Online Comment System (OCS)

<https://ocs-new.ippc.int/>

2017 Short Guide

Food and Agriculture Organization
of the United Nations

International Plant Protection Convention
Protecting the world's plant resources from pests

Why do we need an OCS? Mission and benefits

OCS mission: To provide a simple, efficient, user-friendly online system to share, collect and compile comments on documents.

OCS benefits:

- Easy to use and access
- Confidential and safe
- Implements a standard commenting format
- Faster and more accurate compilation process

Online Comment System (OCS)

URL: <https://ocs-new.ippc.int/>

Compatible with main browsers and devices

User types and roles:

Review Owner: IPPC Secretariat (OCS role: Admin-Author)

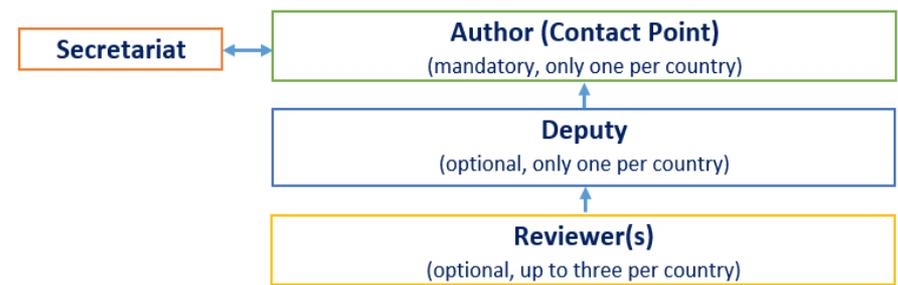

Author: IPPC Contact Point (OCS role for members: Admin-Author; OCS role for observers: Author)

Deputy: user delegated by Author to perform all actions but not user creation and final publishing (OCS role: Author)

Reviewer: all other users, able to insert comments in the system within a workgroup if invited

Participants (to a review): Author, Deputy, Reviewer

User: everyone holding an OCS account

OCS homepage

The screenshot shows the IPPC - OCS web application interface. The top navigation bar is green with 'Admin' and 'Review' tabs. The 'Review' tab is active. The user is logged in as 'Test-CP1' in the 'Workgroup'. The main content area is titled 'new review step 2: upload documents'. It features a table of 'documents already attached to this review:' with one entry: 'OCS Training Scripts.docx' (Type: Review, Status: Successful). Below the table is a dashed box for uploading documents. The sidebar on the left contains the 'please review' logo and navigation links: 'review', 'new review', 'my reviews', 'distribution lists', and 'manage lists'. A red arrow points to the 'my reviews' link. The footer includes '© PleaseTech Ltd. 2004-2016' and 'See Help for 3rd Party legal notices'. Navigation buttons 'Previous' and 'Next' are at the bottom right.

The screenshot shows a web browser interface with a document on the left and a comment box on the right. The document text includes:

This diagnostic protocol was adopted by the Commission on Phytosanitary Measures in 20--.

The annex is a prescriptive part of ISPM 27 (*Diagnostic protocols for regulated pests*).

1. Pest Information

Phytophthora ramorum Werres, de Cock & Man in't Veld (Werres *et al.*, 2001) is an oomycete pathogen of unknown origin (Brasier *et al.*, 2004). It is considered to have been introduced into western North America and western Europe in the late twentieth century by the ornamental plant trade (Prospero *et al.*, 2007; Mascheretti *et al.*, 2008; Goss *et al.*, 2011; Grünwald *et al.*, 2012; Van Poucke *et al.*, 2012). *P. ramorum* attacks a wide range of trees and shrubs in nurseries and in the field, causing leaf blight, stem cankers, bleeding stem lesions and dieback.

In North America the pathogen was found in the early 1990s causing mortality of *Quercus* (oak) trees and *Lithocarpus densiflorus* (tanoaks), mainly in California and Oregon (Rizzo *et al.*, 2002. Named "Sudden Oak Death" (SOD), the disease has reached epidemic proportions in North America at present. The pathogen was originally considered a woodland disease but since 2003 nursery plants in several states of the United States have been affected. The disease has also been found in Canada.

In Europe *P. ramorum* has been observed in Germany since 1993 causing twig blight of rhododendron in nurseries and on mature bushes in gardens. In the Netherlands it was found in 1998 on diseased *Viburnum* sp. (Werres and Marwitz, 1997; Werres *et al.*, 2001). The pathogen has now been recorded in more than 20 European countries, predominantly on ornamental plants in nurseries and in a few managed gardens. In 2009, however, *P. ramorum* was unexpectedly found infecting and killing large numbers of *Larix kaempferi* (Japanese larch) trees in south-west England. Heavy dieback and mortality of plantation *L. kaempferi* trees in western Britain and Northern Ireland have resulted in the felling of 0.6 million trees (Brasier and Webber, 2010; Webber *et al.*, 2010).

This unexpected finding emphasizes that although many of its hosts are known, the main threat of *P. ramorum* is to tree species and other ecologically important plants such as heathland species. The pathogen is, however, most commonly observed on *Camellia*, *Magnolia*, *Pieris*, *Quercus* (in particular *Q. acuta*, *Q. agrifolia*, *Q. cerris*, *Q. chrysolepis*, *Q. ilex* and *Q. rubra* (red oak) species), *Rhododendron* and *Viburnum*. Recent findings and lists of the known hosts for *P. ramorum* can be found in CABI (n.d.), COMTF (n.d.), Fera (2014a, n.d.) and USDA-APHIS (2014a). Disease symptoms and host plants are listed and regularly updated on websites (COMTF, n.d.; Fera, 2014a).

P. ramorum has a complex life cycle and is adapted to cool temperatures, with 20 °C being optimal. Although *P. ramorum* is soil-borne, deciduous, asexually produced sporangia are formed on the surface of infected leaves or twigs and, depending on environmental conditions, are locally splash-dispersed or spread over long distances by wind and wind-driven rain (Davidson *et al.*, 2005). Rivers, streams and other waterways can also carry the sporangia and thus spread the pathogen (Defra, 2007). Sporangia that land on suitable hosts germinate to produce hyphae. In the presence of water, sporangia will release motile zoospores that encyst on the host surface, germinate and penetrate the host tissue, forming a colony from which more sporangia are produced. These sporangia repeat the cycle and with enough generations, under the right environmental conditions, an

The comment box on the right is titled "comments on Test Robert" and "Paragraph Id 49". It contains a text input field with the placeholder "enter an optional comment:" and a "refresh" button. Below the input field is a rich text editor with a toolbar and a preview of the text being edited. The text in the preview is: "Phytophthora ramorum Werres, de Cock & Man in't Veld (Werres *et al.*, 2001) is an oomycete pathogen of unknown origin (Brasier *et al.*, 2004). It is considered to have been introduced into western North America and western Europe in the late twentieth century by the ornamental plant trade (Prospero *et al.*, 2007; Mascheretti *et al.*, 2008; Goss *et al.*, 2011; Grünwald *et al.*, 2012; Van Poucke *et al.*, 2012). *P. ramorum* attacks a wide range of trees and shrubs in nurseries and in the field, causing leaf blight, stem cankers, bleeding stem lesions and dieback." The comment box also has buttons for "Apply", "Apply+Accept", and "Cancel".

Comments received during in-country review

This diagnostic protocol was adopted by the Commission on Phytosanitary Measures in 20--.

The annex is a prescriptive part of ISPM 27 (*Diagnostic protocols for regulated pests*).

Draft Annex to ISPM 27: *Fusarium circinatum* (2006-021)

History 2 box	
<i>This is not an official part of the standard and it will be modified by the IPPC Secretariat after adoption.</i>	
Date of this document	2016-12-15
Document category	Draft annex to ISPM 27 (Diagnostic protocols for regulated pests)
Current document stage	To DP notification period for adoption
Origin	Work programme topic: Fungi and fungus-like organisms, CPM-1 (2006) Original subject: <i>Gibberella circinata</i> (syn. of <i>Fusarium circinatum</i>)
Major stages	2006-05 SC added original subject: <i>Gibberella circinata</i> (2006-021) 2015-03 Expert Consultation on draft DPs 2015-06 TPDP face-to-face meeting 2015-11 SC noted title change from " <i>Fusarium moniliformis</i> / <i>moniliforme</i> syn. <i>F. circinatum</i> " to " <i>Fusarium circinatum</i> " 2016-01 DP drafting group revised document 2016-03 SC e-decision for approval for first consultation (2016_eSC_May_07) 2016-07 First consultation 2016-11 TPDP recommended to SC for adoption (2016_eTPDP_Nov_02) 2016-11 SC e-decision for approval for adoption (2017_eSC_May_03)
Discipline leads history	Hans DE GRUYTER (NL, Discipline Lead) Robert TAYLOR (NZ, Referee)
Consultation technical level	The first draft of this diagnostic protocol was written by: - Ana Pérez-Sierra (Forest Research, United Kingdom) - Renaud loos (ANSES, France) - Mónica Berbegal Martínez (Universidad Politécnica de Valencia, Spain). In addition, the draft has been subject to expert review and the following international experts submitted comments: - Ms Jacqueline Edwards (Victorian Government Department of Economic Development, Jobs, Transport and Resources, Australia) - Mr William Muiru (University of Nairobi, Kenya).
Main discussion points during development of the diagnostic protocol	- It is agreed by the authors that the name <i>Fusarium circinatum</i> is used with <i>Gibberella circinata</i> as synonym, following Geiser et al. (2013). Is morphological identification reliable enough to consider the pathogen present or not? Yes, if all the characteristic features are observed, there is no doubt about the identification. In case one or several features are missing or doubtful, then morphological identification may not be reliable. - Footnotes for brand names (based on SC decision and according to TPDP instruction to authors): If in the DP there is more than one mention to a brand name, the second mention (and the subsequent mentions) to a brand name shall be associated with the footnote number with the full text (e.g. If the first mention to a brand name is "footnote 1", the subsequent mentions to brand names should be accompanied by the same footnote number).
Notes	This is a draft document. 2016-01-15 Edited 2016-11-07 Edited

The OCS and IPPC Regional Workshops

Before the Regional Workshop

- **Step 1:** Ensure you have received your IPPC OCS login information.
- **Step 2:** Beginning 1 July, review the draft ISPMs by consulting relevant subject matter experts.
- **Step 3:** Enter the organization's comments into the OCS prior to the workshop.
- **Step 4:** Contact Points decide whether to share comments with all the other organizations present at the workshop.

During the Regional Workshop

- **Step 5:** The organizer shows comments by countries in the region (members of the sub-team) on the screen; only substantive and technical comments are discussed at the workshop.
- **Step 6:** Participants come to an agreement on comments, which are modified / posted to the OCS by the organizer.

After the Regional Workshop

- **Step 7:** Review the final workshop comments and determine whether to accept them
- **Step 8:** Contact Points can conduct further reviews of the draft ISPMs.
- **Step 9:** Contact Points finalize comments by 30 September.

DRAFT STANDARD FOR DRIED THYME

(at Step 6 of the Procedure)

1 **SCOPE**

This Standard applies to dried leaves/ flowers of thyme (*Thymus spp.*) of the *Lamiaceae* family offered for industrial food production as a condiment and for direct human consumption or for repackaging if required. It does not apply to the product when indicated as being intended for further processing. It does not apply to the product when indicated as being intended for further processing.

2 **DESCRIPTION**

2.1 Product Definition

Dried thyme is the product prepared from leaves/ flowers of *Thymus spp.* processed in an appropriate manner, undergoing operations such as cleaning, drying, rubbing, milling and sifting.

2.2 Styles

Dried thyme leaves/ flowers may be offered in one of the following styles:

- Whole / intact.
- Crushed/rubbed: processed into varying degrees ranging from a coarse to fine crush.
- Ground/powdered: processed into powders.

2.3 Varietal Types

All wild species and varieties or cultivars and hybrids belonging to the genus *Thymus*, which are suitable for processing.

3 **ESSENTIAL COMPOSITION AND QUALITY FACTORS**

3.1 Composition

Product as defined in Section 2.

3.2 Quality Factors

3.2.1 Odour, flavour and colour

Dried thyme shall have a characteristic odour and flavour according to the chemical components of the volatile oil (such as thymol, carvacrol, and linalool), which can vary depending on geo-climatic factors/conditions. Dried thyme shall be free from any foreign odour or flavour and especially from mustiness. Dried thyme shall have a characteristic colour varying from green ash to brownish grey.

3.2.2 Infestation

Dried thyme shall be free from live insects and practically free from insects, dead insects, insect fragments and rodent contamination visible to the naked eye (corrected, if necessary, for abnormal vision).

3.2.3 Physical Characteristics

Dried thyme shall comply with the physical requirements specified in Table 1, excluding ground/powdered style.

Brazil
Proposed Change [39], by Brazil (30 Sep 2016 9:49 PM)
Correct writing of "spp." (remove italics) - The correct inscription of the species acronym "spp." precludes the use of

Chile
Comment [37], by Chile (30 Sep 2016 5:26 PM)
Regarding the sentence [It does not apply to the product when indicated as being intended for further processing.], the concept of "further processing" is not clear, neither its

IOSTA
Comment [31], by IOSTA (28 Sep 2016 8:23 PM)
There is a difference of opinion with European Spice Association suggesting 0.5% for processed material is too

IOSTA
Comment [30], by IOSTA (28 Sep 2016 8:20 PM)
Thymus spp. is too broad. Two recommendations:
1. *Thymus vulgaris* (as described in ISO 6754)

Egypt
Comment [2], by Egypt (15 Aug 2016 12:48 PM)
Keep the sentence [It does not apply to the product when indicated as being intended for further processing.]

India
Proposed Change [36], by India (30 Sep 2016 11:08 AM)
This Standard applies to dried leaves/ flowers of thyme (*Thymus spp.*) of the *Lamiaceae* family offered for industrial food production as a condiment-culinary herb and for direct human consumption or for repackaging

Brazil
Proposed Change [38], by Brazil (30 Sep 2016 9:47 PM)
Removal of square brackets - The rationale is Not to overrule trade of Thyme in bulk for further processing with provisions established for ready to eat products, we would like to

Brazil
