2006-05 SC revised standard and approved for MC.

2006-06 MC.

2006-11 SC revised standard for adoption.

2007-03 CPM-2 adopted revised ISPM 5. 2007.

2006-03 CPM-1 created the Technical Panel for the Glossarv (TPG).

2006-10 1st meeting of the TPG. TPG revised standard.

2007-05 SC revised standard and approved for MC.

2007-06 MC.

2007-11 SC approved draft to be submitted for adoption.

2008-04 CPM-3 adopted revised ISPM 5. 2008.

2007-10 TPG revised standard.

2008-05 SC-7 revised standard and approved for MC.

2008-06 MC.

2008-11 SC approved draft to be submitted for adoption.

2009-03 CPM-4 adopted revised ISPM 5. 2009.

2008-10 TPG revised standard.

2009-05 SC revised standard and approved for MC.

2009-06 MC.

2009-11 SC approved draft to be submitted for adoption.

2010-03 CPM-5 adopted revised ISPM 5. 2010.

2009-06 TPG started reviewing adopted standards for consistency in the use of terms.

2010-10 TPG drafted amendments.

2011-05 SC revised draft and approved for MC.

2011-06 MC.

2011-11 SC approved draft to be submitted for adoption.

2012-03 CPM-7 adopted revised ISPM 5. 2012.

2012-10 TPG drafted amendments.

2013-06 MC.

2014-05 SC-7 approved draft for SCCP.

2014-06 SCCP.

2014-11 SC approved draft to be submitted for adoption.

2015-03 CPM-10 adopted revised ISPM 5. 2015.

2013-02 TPG drafted amendments.

2014-05 SC revised draft and approved for MC.

2014-07 MC.

2015-05 SC-7 approved for SCCP.

2015-06 SCCP.

2015-11 SC approved draft to be submitted for adoption.

2016-04 CPM-11 adopted revised ISPM 5. 2016.

Supplement 1

1999-10 ICPM-2 added topic Official control (1999-002).

2000-03 EWG developed draft text.

2000-05 ISC-1 revised draft text and approved for MC.

2000-06 MC.

2000-11 ISC-2 approved draft to be submitted for adoption.

2001-04 ICPM-3 adopted Supplement 1 to ISPM 5.

ISPM 5. Supplement 1 Guidelines on the interpretation and application of the concept of official control for regulated pests (2001).

2005-03 ICPM-7 added the topic not widely distribed (2005-008) (supplement to ISPM 5: Glossa phytosanitary terms).

2006-05 SC approved specification 33.

2008-05 SC-7 reviewed draft.

2011-05 SC approved for MC.

2011-06 MC

2011-11 TPG reviewed member con.

2011-11 SC approved draft supplement to

2012-03 CPM-7 adopted revision supplement 1 to 120 5

ISPM 5. Supplement 1. Governess on the interpression and application of the incepts of official control" and "not widely distributes 19012)

Supplement 2

2001-04 ICPM add top. Druing economic important (2001-01).

2002-02 G develor A draft text.

2002-05 SC vised an term approved for MC.

2002-06 MC.

2002-11 SC revis draft text for adoption.

2003-04 ICPM-5 adopted Supplement 2 to ISPM 5.

ISPM 5. Supplement 2 Guidelines on the understanding of "potential economic importance" and related terms including reference to environmental considerations (2003).

Appendix 1

2005-03 ICPM-7 IPPC and CBD (Convention on Biological Diversity) secretariats decided cooperation programme 2006-04 CPM-1 agreed assess progress on the work programme (2006-033).

2006-10 TPG developed draft text.

2007-05 SC requested TPG to develop draft text CBD terms.

2007-10 TPG developed draft text.

2008-05 SC revised draft text and approved for MC.

2008-06 MC.

2008-11 SC revised draft text for abotion.

2009-03 CPM-4 adopted Apr Laix T. SPM 5.

ISPM 5. Appendix 1 Termology of the Convention on Biological Diversity of relation to the Glossary of phytosanitary terms (2, 3).

Ink amendmen

2010-03 CPM noted and IPPC per dariat applied ink amend onts to Symptoment 1 (E. glish version).

2011-03 CPUS note and IPPC Secretariat applied ink an endment and: "effice" (of a treatment)", "e ablishment "introducion", "spread", "regulated at ", "consign are "inspection", "quarantine", Suplement 1, 4 (Exprish version).

1131314 Problem of the distribution of the environment environment environment of the environment environment of the environment environment of the environment environment

2015-03 CPM-10 noted and IPPC Secretariat applied ink amendments to the terms: "bulbs and tubers", "cut flowers and branches", "fruits and vegetables", "grain", "plants in vitro", "seeds", "wood".

2015-05 IPPC Secretariat corrected a mistake introduced in the definition of "pest free area" and "area of low pest prevalence".

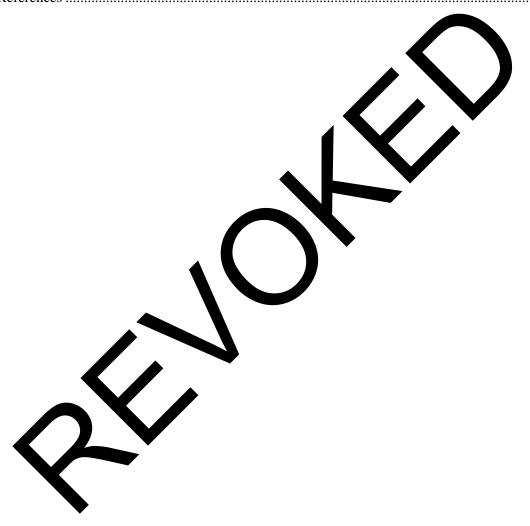

2016-04 IPPC Secretariat adjusted the sources of definitions to not include "revision" for ink amendments following TPG 2015-12 decision.

Publication history last modified: 2016-06.

Adoption

This standard was first recommended for publication as an international standard by the FAO Committee of Experts on Phytosanitary Measures in 1996, and published in 1997. The first version of the Glossary as ISPM 5 was adopted by the Second Session of the Interim Commission on Phytosanitary Measures in 1999. It has undergone repeated modifications since then. The current edition of ISPM 5 arises from an amendment adopted by the Eleventh Session of the Commission on Phytosanitary Measures in April 2016.

Supplement 1 was first adopted by the Third Session of the Interim Commission on Phytosanitary Measures in April 2001. The first revision of Supplement 1 was adopted by the Seventh Session of the Commission on Phytosanitary Measures in March 2012. Supplement 2 was adopted by the Fifth Session of the Interim Commission on Phytosanitary Measures in April 2003. Appendix 1 was adopted by the Fourth Session of the Commission on Phytosanitary Measures in March–April 2009.

INTRODUCTION

Scope

This reference standard is a listing of terms and definitions we specify meaning for phytosanitary systems worldwide. It has been developed to provide a harr pnize transitional agreed vocabulary associated with the implementation of the International ant Providing onvention (IPPC) and International Standards for Phytosanitary Measures (ISPMs)

Within the context of the IPPC and its ISPMs, all references of plants a buld be understood to continue to include algae and fungi, consistent with the Linear ional code of Nomenclature for algae, fungi, and plants.

Purpose

The purpose of this reference standard is o included by and consistency in the use and understanding of terms and definitions which are used y contracting parties for official phytosanitary purposes, in phytosanitary legislation and resolutions, well as for official information exchange.

References

The references below orrest and to the approval of terms and definitions, as indicated in the definitions. For ISPMs, they do a indicate the most recent version (which is available on the IPP at https://www.apc.ac/core-stylt/a/standards-setting/ispms).

Outline of Reference

The purpose of this standard is to assist national plant protection organizations (NPPOs) and others in information exchange and the harmonization of vocabulary used in official communications and legislation pertaining to phytosanitary measures. The present version incorporate thio is agreed as a result of the approval of the International Plant Protection Convention (1997) and terms indeed through the adoption of additional International Standards for Phytosanitary Measure (ISPMs).

The Glossary contains all terms and definitions approved until the Elevanth Sesson of the commission on Phytosanitary Measures (CPM, 2016). References in square brackets refer to the proval of the term and definition, and not to subsequent adjustments in translation.

As in previous editions of the Glossary, terms in definitions to other Glossary terms and to avoid unnecessary repetition of element described elsewhere in the Glossary. Derived forms of words that appear in the Glossary terms.

PHYTOSANITARY TERMS AND DEFINITIONS

* Indicates that the term, at the time of publishing, is on the work programme of the Technical Panel for the Glossary which means the terms or definitions may be revised or deleted in the future.

absorbed dose Quantity of radiating energy absorbed per unit of mass of a specified

target [ISPM 18, 2003, revised CPM, 2012]

additional declaration A statement that is required by an importing country to be entered on a

> phytosanitary certificate and which provides specific additional information on a consignment in relation to regulated pests or regulated articles [FAO, 1990; revised ICPM, 2005; CPM, 2016]

area An **officially** defined country, part of a country or all or parts of several

> countries [FAO, 1990; revised ISPM 2, 1995; 9; based on the World Trade Organization Agreement on Application f Sanitary

and Phytosanitary Measures (WTO, 1994)

area endangered See endangered area

An area, whether all of a country area of low pest country, or all or parts of prevalence several countries, as identified forities, in which a petent

by the s subject to effective specific **pest** is present at low evels ar surveillance or control measure es [IPPC, revised CPM, 2015]

nch or root outside the cambium [CPM, bark* The layer of a woody trun

2008]

hich all bark bark-free wood Wood from except ingrown bark around knots and bark

> pockets n rings of a hual growth, has been removed [ISPM 15,

2002; re M. 2008

nemy, antagonist or competitor, or other organism, used for biological control agent A natural

[ISPM 3, 1995; revised ISPM 3, 2005] contro

anding or adjacent to an area officially delimited for ytosanitary purposes in order to minimize the probability of spread of the target pest into or out of the delimited area, and subject to anitary or other **control** measures, if appropriate [ISPM 10, 1999;

sed ISPM 22, 2005; CPM, 2007]

Dormant underground parts of **plants** intended for **planting** (includes bulbs a tub commod

corms and rhizomes) [FAO, 1990; revised ICPM, 2001]

Treatment of wood with a chemical preservative through a process of chemical pres impregnation

pressure in accordance with an **official** technical specification

[ISPM 15, 2002; revised ICPM, 2005]

clearance (of a Verification of compliance with **phytosanitary regulations** [FAO,

consignment) 1995]

buffer zone

The Commission on Phytosanitary Measures established under Article **Commission**

XI [IPPC, 1997]

commodity A type of **plant**, **plant product**, or other article being moved for trade

or other purpose [FAO, 1990; revised ICPM, 2001]

commodity class* A category of similar **commodities** that can be considered together in

phytosanitary regulations [FAO, 1990]

A list of **pests** present in an **area** which may be associated with a specific commodity pest list

commodity [CEPM, 1996; revised CPM, 2015]

Official procedure used to verify that a consignment complies with compliance procedure (for a **consignment**) phytosanitary import requirements or phytosanitary measures related to **transit** [CEPM, 1999; revised CPM, 2009]

confinement (of a Application of phytosanitary measures to a regulated article to regulated article)* prevent the escape of **pests** [CPM, 2012]

consignment A quantity of **plants**, **plant products** or other articles being moved from one country to another and covered, when phytosanitary certificate (a consignment ma of one or be compo more **commodities** or **lots**) [FAO, 1990; revi JCPM, 200

A consignment which passes through consignment in transit imported, and that may be subject to phy anitary FAO, 1990; 2002; ISPM 25, 2006; revised CEPM, 1996; CEPM, 19 formerly "country of transit"]

Application of **phytosanitary** around an infested area neasures it to prevent **spread** of a

> A **pest** that is q modity and, in the case of plants and plant produc se plants or plant products [CEPM, does no 1996; revised CEPM, 199

> Presenc mmodity storage place, conveyance or container, of pests or articles, not constituting an infestation (see [CEPM, 1997; revised ICPM, 1999] nfestation

Supp containment or eradication of a pest population [FAO, 1995]

Documented plan of **phytosanitary actions** to be implemented in an ricially delimited for phytosanitary purposes if a **pest** is detected colerance level is exceeded or in the case of faulty implementation officially established procedures [CPM, 2009]

Country where the **plants** from which the **plant products** are derived were grown [FAO, 1990; revised CEPM, 1996; CEPM, 1999]

Country where the **plants** were grown [FAO, 1990; revised CEPM, 1996; CEPM, 1999]

Country where the regulated articles were first exposed to contamination by pests [FAO, 1990; revised CEPM, 1996; CEPM, 19991

Fresh parts of plants intended for decorative use and not for planting [FAO, 1990; revised ICPM, 2001]

containment

contaminating pest*

contamination*

control (of a pest)

corrective action

(in an area)

country in (of a consignmen f plant products)

country of origin (of a consignment of plants)

country of origin (of regulated articles other than plants and plant products)

cut flowers and branches (as a commodity class)* debarked wood Wood that has been subjected to any process that results in the removal

of bark. (Debarked wood is not necessarily bark-free wood.) [CPM,

2008; replacing "debarking"]

Survey conducted to establish the boundaries of an **area** considered to delimiting survey

be infested by or **free from** a **pest** [FAO, 1990]

Survey conducted in an area to determine if pests are present [FAO, detection survey

1990; revised FAO, 1995]

detention Keeping a consignment in official custody or confinement, as a

phytosanitary measure (see quarantine) [FAO, 1990; revised FAO,

This supplement was first adopted by the Third Session of the Interim Commission on Phytosanitary Measures in April 2001.

The first revision of this supplement was adopted by the Seventh Session of the

Commission on Phytosanitary Measures in March 2012.

The supplement is a prescriptive part of the standard.

SUPPLEMENT 1: Guidelines on the interpretation and application of the concepts of "official control" and "not widely distributed"

INTRODUCTION

Scope

This supplement provides guidance on:

- the official control of regulated pests, and
- determination of when a pest is considered to be present but not idely distributed, for the decision on whether a pest qualifies as a quarantine pest.

References

The present standard refers to ISPMs. ISPMs are available on the Increase and Phytosanitary Portal (IPP – www.IPPC.int).

Definition

Official control is defined as:

The active enforcement of mandatory phy sanitary regular ons and the application of mandatory phytosanitary procedures with the objective of eradication or containment of quarantine pests or for the management of regulated non-quarantine pests.

BACKGROUND

The words "present but not we by distributed and being officially controlled" express an essential concept in the definition of quarantine pet according to that definition, a quarantine pest must always be of potential economy importance to an endangered area. In addition, it must either meet the criterion of not being present to that as a or it must meet the combined criteria of being present but not widely distributed and subject which all combined criteria of being present but not widely distributed and subject which are a combined criteria.

The Glossa of potosame warms defines official as "established, authorized or performed by an NPPO" of control as "suppression, containment or eradication of a pest population". However, for phytosame warp poses, concept of official control is not adequately expressed by the combination of these two continuous.

The purpose of the supplement is to describe more precisely the interpretation of:

- the concept of official control and its application in practice for quarantine pests that are present in an area as well as for regulated non-quarantine pests, and
- the concept of "present but not widely distributed and under official control" for quarantine pests.

REQUIREMENTS

1. General Requirements

Official control is subject to ISPM 1, in particular the principles of non-discrimination, transparency, equivalence of phytosanitary measures and pest risk analysis.

[&]quot;Not widely distributed" is not a term included in the description of pest status listed in ISPM 8.

1.1 Official control

Official control includes:

- eradication and/or containment in the infested area(s)
- surveillance in the endangered area(s)
- restrictions related to the movement into and within the protected area(s) including phytosanitary measures applied at import.

All official control programmes have elements that are mandatory. At minimum, programme evaluation and pest surveillance are required in official control programmes to determine the need for and effect of control to justify phytosanitary measures applied at import for the same purpose. Phytosanitary measures applied at import should be consistent with the principle of non-discrimination (see section 2.2 below).

For quarantine pests, eradication and containment may have an element of supposes. For regulated non-quarantine pests, suppression may be used to avoid unacceptable economic impact that applies to the intended use of plants for planting.

1.2 Not widely distributed

"Not widely distributed" is a concept referring to a pest's occurrace and intribution, within an area. A pest may be categorized as present and widely distributed in at area or received widely distributed, or absent. In pest risk analysis (PRA), the determination of whether a set is no yidely distributed is carried out in the pest categorization step. Transience means that a pest not expect to establish and therefore is not relevant to the concept of "not widely distributed".

distributed, the importing country should In the case of a quarantine pest that is present by wia define the infested area(s) and the endangere parantine pest is considered not widely area(s): distributed, this means that the pest is limited to parts of i poternal distribution and there are areas free from the pest that are at risk of economic l s from its in duction or spread. These endangered areas do not need to be contiguous but may of several stinct parts. In order to justify the statement delimitation of the endangered areas should be of a pest being not widely distributed, a made available if requested. There is degree of uncertainty attached to any categorization of distribution. The categorization ange over time. also d

The area in which the est is not widely stributed should be the same as the area for which the e endangered area) and where the pest is under or being considered for economic impact ar that a post is a quarantine pest, including consideration of its distribution, official control. The and placing th official Introl, is typically made with respect to an entire country. However, appropriate to regulate a pest as a quarantine pest in parts of a country in some ins rather th in the <u>dole</u> counce. It is the potential economic importance of the pest for those parts that has to be mining phytosanitary measures. Examples of when this may be appropriate are countrie hose territories include one or more islands or other cases where there are natural or artificially crea barriers to pest establishment and spread, such as large countries in which specified crops are restricted by climate to well-defined areas.

1.3 Decision to apply official control

A national plant protection organization (NPPO) may choose whether or not to officially control a pest of potential economic importance that is present but not widely distributed, taking into account relevant factors from PRA, for example the costs and benefits of regulating the specific pest, and the technical and logistical ability to control the pest within the defined area. If the pest is not subjected to official control, it does not then qualify as a quarantine pest.

2. Specific Requirements

The specific requirements to be met relate to pest risk analysis, technical justification, non-discrimination, transparency, enforcement, mandatory nature of official control, area of application, and NPPO authority and involvement in official control.

2.1 Technical justification

Domestic requirements and phytosanitary import requirements should be technically justified and result in non-discriminatory phytosanitary measures.

Application of the definition of a quarantine pest requires knowledge of potential economic importance, potential distribution and official control programmes (ISPM 2). The categorization of a pest as present and widely distributed or present but not widely distributed is determined in relation to its potential distribution. This potential distribution represents the areas where the pest could established if given the opportunity, i.e. its hosts are present and environmental factors su as clim and soil are sessing the p favourable. ISPM 11 provides guidance on the factors to be considered in bability of est that i establishment and spread when conducting a pest risk analysis. In the bresent but not widely distributed, the assessment of potential economic importa should r areas where the pest is not established.

Surveillance should be used to determine the distribution of basis for the further PM 6 p consideration of whether the pest is not widely distributed. des dance on surveillance, and includes provisions on transparency. Biological factors ich as pest cycle, means of dispersal and rate of reproduction may influence the design of programmes, the interpretation of survey data and the level of confidence in the categoriz of a pest as not widely distributed. The distribution of a pest in an area is not a static ging conditions or new information may necessitate reconsideration of whether a per s not wide dista

2.2 Non-discrimination

The principle of non-discrimination between domestic requirements and phytosanitary import requirements is fundamental. In particula, requirements for imports should not be more stringent than the effect of official control in a import grountry. There should therefore be consistency between domestic requirements are phytosanic with port requirements for a defined pest:

- Import requirements should not be more stringent than domestic requirements.
- Domestic and aport quirements should be the same or have an equivalent effect.
- Mandater element of dome ac and import requirements should be the same.
- The idensity of inspection of imported consignments should be the same as equivalent processes in somestic ontrol programmes.
- In the coordinate of non-compliance, the same or equivalent phytosanitary actions should be taken on importations as are taken domestically.
- If a tolerant level is applied within a domestic official control programme, the same tolerance level should be applied to equivalent imported material. In particular, if no action is taken in the domestic official control programme because the pest incidence does not exceed the tolerance level concerned, then no action should be taken for an imported consignment if the pest incidence does not exceed that same tolerance level. Compliance with import tolerance levels is generally determined by inspection or testing at entry, whereas compliance with the tolerance level for domestic consignments should be determined at the last point where official control is applied.
- If downgrading or reclassifying is permitted within a domestic official control programme, similar options should be available for imported consignments.

2.3 Transparency

Domestic requirements for official control and the phytosanitary import requirements should be documented and made available, on request.

2.4 Enforcement

The domestic enforcement of official control programmes should be equivalent to the enforcement of phytosanitary import requirements. Enforcement should include:

- a legal basis
- operational implementation
- evaluation and review
- phytosanitary action in the case of non-compliance.

2.5 Mandatory nature of official control

Official control is mandatory in the sense that all persons involved are legally bound to perform the actions required. The scope of official control programmes for quarantine pests is completely mandatory (e.g. procedures for eradication campaigns), whereas the scope for regulated and antique antique pests is mandatory only in certain circumstances (e.g. official certification programmes).

2.6 Area of application

An official control programme can be applied at national, subnatical or local article. The area of application of official control measures should be specified. At phytocalitary import requirements should have the same effect as the domestic requirements for office or arol.

2.7 NPPO authority and involvement in official control

Official control should:

- be established or recognized by the contracting part of the NPPO under appropriate legislative authority
- be performed, managed, supervised a, at minimum audited/reviewed by the NPPO
- have enforcement assured by the conjecting party the NPPO
- be modified, terminated or lose a ficial sognitive by the contracting party or the NPPO.

Responsibility and accountability for original control programmes rests with the contracting party. Agencies other than the MPO is the reponsible for aspects of official control programmes, and certain aspects of official control program, and may be the responsibility of subnational authorities or the private sector. The MPO should be fully aware of all aspects of official control programmes in its country.

This supplement was adopted by the Fifth Session of the Interim Commission on Phytosanitary Measures in April 2003.

The supplement is a prescriptive part of the standard.

SUPPLEMENT 2: Guidelines on the understanding of "potential economic importance" and related terms including reference to environmental considerations

1. Purpose and Scope

These guidelines provide the background and other relevant information to clarify *potential economic importance* and related terms, so that such terms are clearly understood and their application is consistent with the International Plant Protection Convention (IPPC) and the International Standards for Phytosanitary Measures (ISPMs). These guidelines also show the application of certain economic principles as they relate to the IPPC's objectives, in particular in protecting uncultivated/unmanaged plants, wild flora, habitats and ecosystems with respect to invasive alien species that are pests.

These guidelines clarify that the IPPC:

- can account for environmental concerns in economic terms using a petary or n emonetary values
- asserts that market impacts are not the sole indicator of pest apact
- maintains the right of contracting parties to adopt phytosa tary reasures with respect to pests for which the economic damage caused to plants, plants process or economic within an area cannot be easily quantified.

They also clarify, with respect to pests, that the scope of the protection of cultivated plants in agriculture, horticulture and forestry, uncultivated plants, wild flora, habitats and ecosystems.

2. Background

The IPPC has historically maintained that the diverse copoliunces of pests, including those concerning uncultivated/unmanaged plants, wild floa, has the decosystems, are measured in economic terms. References to the terms *economic effects*, *economic impacts*, *potential economic importance* and *economically unacceptable imp*, and thouse of the word *economic* in the IPPC and in ISPMs has resulted in some misunder anding or that lication of such terms and of the focus of the IPPC.

plies to the protection of wild flora resulting in an important contribution The scope of the Co ention 2 to the conservation of cal diversity. However, it has been misinterpreted that the IPPC is only scope. It has not been clearly understood that the IPPC can account commercially imited? conomic terms. This has created issues of consistency with other for environ onceri s, includ agreeme g the Con vention on Biological Diversity and the Montreal Protocol on Substances that Depl

3. Econome Terms and Environmental Scope of the IPPC and ISPMs

The economic terms found in the IPPC and ISPMs may be categorized as follows.

Terms requiring judgement to support policy decisions:

- potential economic importance (in the definition for quarantine pest)
- economically unacceptable impact (in the definition for regulated non-quarantine pest)
- economically important loss (in the definition for endangered area).

Terms related to evidence that supports the above judgements:

- limit the economic impact (in the definition for phytosanitary regulation and the agreed interpretation of phytosanitary measure)
- economic evidence (in the definition for pest risk analysis)
- cause economic damage (in Article VII.3 of the IPPC, 1997)

- direct and indirect *economic impacts* (in ISPM 11 and ISPM 16)
- economic consequences and potential economic consequences (in ISPM 11)
- commercial consequences and non-commercial consequences (in ISPM 11).

ISPM 11 notes in section 2.1.1.5 with respect to pest categorization, that there should be a clear indication that the pest is likely to have an unacceptable economic impact, including environmental impact, in the PRA area. Section 2.3 of the standard describes the procedure for assessing potential economic consequences of a pest introduction. Pest effects may be considered to be direct or indirect. Section 2.3.2.2 addresses analysis of commercial consequences. Section 2.3.2.4 provides guidance on the assessment of the non-commercial and environmental consequences of pest introduction. It acknowledges that certain types of effects may not apply to an existing market that can be easily identified, but it goes on to state that the impacts could be approximated with an appropriate non-market valuation method. This section notes that if a quantitative measurement is not feasible, then this part of the assessment should at least include a qualitative analysis and an explanation information ares are cove is used in the PRA. Environmental or other undesirable effects of control me d in section 2.3.1.2 (Indirect pest effects) as part of the analysis of potential economic of quences. here a pest risk is found to be unacceptable, section 3.4 provides guidance on the anagement st risk options, including measurements of cost-effectiveness, feasibility eness.

In April 2001 the ICPM recognized that under the IPPC's exting handate to take account of environmental concerns, further clarification should include concerns the following five proposed points relating to potential environmental risks of the state of

- reduction or elimination of endangered (or three ned entire plant species
- reduction or elimination of a keystone plant specific species which plays a major role in the maintenance of an ecosystem)
- reduction or elimination of a plant species which is major component of a native ecosystem
- causing a change to plant biological diversity a such a way as to result in ecosystem destabilization
- resulting in control, eradication of panages. Programmes that would be needed if a quarantine pest was introduced, art impacts of such programmes (e.g. pesticides, non-indigenous predators or parasites) on biological acception.

Thus it is clear, with respect to plant pests, that the scope of the IPPC covers the protection of cultivated plants in agriculture sorticulare and forestry, uncultivated/unmanaged plants, wild flora, habitats and ecosystems.

4. Ecc. omic bonside. ons in PRA

4.1 Ty s of some effect

In PRA, economic effects should not be interpreted to be only market effects. Goods and services not sold in commerce markets can have economic value, and economic analysis encompasses much more than the study of market goods and services. The use of the term *economic effects* provides a framework in which a wide variety of effects (including environmental and social effects) may be analysed. Economic analysis uses a monetary value as a measure to allow policy makers to compare costs and benefits from different types of goods and services. This does not preclude the use of other tools such as qualitative and environmental analyses that may not use monetary terms.

4.2 Costs and benefits

A general economic test for any policy is to pursue the policy if its benefit is at least as large as its cost. Costs and benefits are broadly understood to include both market and non-market aspects. Costs and benefits can be represented by both quantifiable measurements and qualitative measurements. Non-market goods and services may be difficult to quantify or measure but nevertheless are essential to consider.

Economic analysis for phytosanitary purposes can only provide information with regard to costs and benefits, and does not judge if one distribution is necessarily better than another distribution of costs and benefits of a specific policy. In principle, costs and benefits should be measured regardless to whom they occur. Given that judgements about the preferred distribution of costs and benefits are policy choices, these should have a rational relationship to phytosanitary considerations.

Costs and benefits should be counted whether they occur as a direct or indirect result of a pest introduction or if a chain of causation is required before the costs are incurred or the benefits realized. Costs and benefits associated with indirect consequences of pest introductions may be less certain than costs and benefits associated with direct consequences. Often, there is no monetary information about the cost of any loss that may result from pests introduced into natural environments. Any analysis should identify and explain uncertainties involved in estimating costs and benefits and assumptions should be clearly stated.

5. Application

The following criteria¹ should be met before a pest is deemed to have patents economic is portance:

- a potential for introduction in the PRA area
- the potential to spread after establishment
- a potential harmful impact on plants, for example:
 - · crops (for example loss of yield or quality)
 - the environment, for example damage to cosystems, habitats a species
 - some other specified value, for example real at in, to a casthetics.

As stated in section 3, environmental damage attroduction of a pest, is one of the types the th of damage recognized by the IPPC. Thus, th respect rd criterion above, contracting parties to the IPPC have the right to adopt phytosa tary measure even with respect to a pest that only has the potential for environmental damage. S n should l based upon a pest risk analysis that includes th a al damage. When indicating the direct and the consideration of evidence of pote indirect impact of pests on the environ ent, the nature of the harm or losses arising from a pest introduction should be specific analysis.

In the case of regulate con-quarantine, because such pest populations are already established, introduction in an art of concern and environmental effects are not relevant criteria in the consideration of *economically unactor* (see ISPM 16 and ISPM 21).

_

¹ With respect to the first and second criteria, IPPC (1997) Article VII.3 states that for pests that may not be capable of establishment, measures taken against these pests must be technically justified.

This appendix is for reference purposes only and is not a prescriptive part of the standard.

APPENDIX TO SUPPLEMENT 2

This appendix provides additional clarification of some terms used in this supplement.

Economic analysis: It primarily uses monetary values as a measure to allow policy makers to compare costs and benefits from different types of goods and services. It encompasses more than the study of market goods and services. Economic analysis does not prevent the use of other measures that do not use a monetary value; for example, qualitative or environmental analysis.

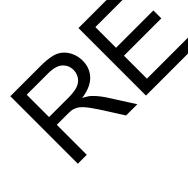

Economic effects: This includes market effects as well as non-market effects, such as environmental and social considerations. Measurement of the economic value of environmental effects or social effects may be difficult to establish. For example, the survival and well-being of another species or the value of the aesthetics of a forest or a jungle. Both qualitative and quantitative worth may considered in measuring economic effects.

Economic impacts of plant pests: This includes both market measures as we as those consequences that may not be easy to measure in direct economic terms, but which represent a loss of damage to cultivated plants, uncultivated plants or plant products.

Economic value: This is the basis for measuring the cost of the effect. Change (e.g. in biodiversity, ecosystems, managed resources or natural resources) on hun in welfax. Good and services not sold in commercial markets can have economic value. Determining conomic values not prevent ethical or altruistic concerns for the survival and well-being of corps.

Qualitative measurement: This is the valuation littles characteristics in other than monetary or numeric terms.

Quantitative measurement: This is the valuation of qualies or characteristics in monetary or other numeric terms.

This appendix was adopted by the Fourth Session of the Commission on Phytosanitary Measures in March–April 2009.

The appendix is for reference purposes only and is not a prescriptive part of the standard.

APPENDIX 1: Terminology of the Convention on Biological Diversity in relation to the *Glossary of phytosanitary terms*

1. Introduction

Since 2001, it has been made clear that the scope of the IPPC extends to risks arising from pests that primarily affect the environment and biological diversity, including harmful plants. The Technical Panel for the Glossary, which reviews ISPM 5 (*Glossary of phytosanitary terms*, hereinafter referred to as the Glossary), therefore examined the possibility of adding new terms and definitions to the standard to cover this area of concern. In particular, it considered the terms and definitions that are in use by the Convention on Biological Diversity (CBD)*, with a view to adding them to the Glossary, as has previously been done in several cases for the terminology of other intergovernmental canada anizations.

However, study of the terms and definitions available from the CBD has shown that they be based on concepts different from those of the IPPC, so that similar terms are given districtly different meanings. The CBD terms and definitions could not accordingly be used directly in the Globary it was decided instead to present these terms and definitions in the present appendix of the Consary, providing explanations of how they differ from IPPC terminology.

This Appendix is not intended to provide a clarification of the scope of the IPPC.

2. Presentation

In relation to each term considered, the CB definition provided. This is placed alongside an "Explanation in IPPC context", in which, a terms (or derived forms of Glossary terms) isual, Gloss are shown in **bold**. These explanation CBD terms, in which case these are also in also include ma **bold** and followed by "(CBD)". The olan ns cons te the main body of this Appendix. Each is followed by notes, providing further cla ne of the difficulties. icatio.

3. Terminology

3.1 "Alien species

CBD definition	Explanation in IPPC context
introduced outside its nature past ¹ or present distributes; in acceptant, gametes, seeds,	An alien ² species (CBD) is an individual ³ or population, at any life stage, or a viable part of an organism that is non-indigenous to an area and that has entered ⁴ by human agency ⁵ into the area

Notes:

¹ The qualification concerning "past and present" distribution is not relevant for IPPC purposes, since the IPPC is concerned only with existing situations. It does not matter that the species was present in the past if it is present now. The word "past" in the CBD definition presumably allows for the reintroduction of a species into an area where it has recently become extinct and thus a reintroduced species would presumably not be considered an alien species.

-

² "Alien" refers only to the location and distribution of an organism compared with its natural range. It does not imply that the organism is harmful.

^{*} The terms and definitions discussed in this document have resulted from discussion on invasive alien species by the Parties of the Convention on Biological Diversity (Secretariat of the Convention on Biological Diversity).

3.2 "Introduction"

CBD definition	Explanation in IPPC Intext
direct, of an alien species ⁶ outside of its natural range (past or present). This movement can be either within a country or	The entry of a socies into an area ordere it is non-indigenous, through revenent by human agency, either directly from an area ordere the species is indigenous, in indirectly of successive movement from a area where the species is indigenous through one or so en areas or re it is not)

Notes:

3.3 "Invasive alien species"

CBD definition	Explanation in IPPC context
An alien species whose introduction and/or spread threaten ⁹ biological diversity ^{10, 11}	An invasive ¹² alien species (CBD) is an alien species (CBD) that by its establishment or spread has become injurious to plants ¹³ , or that by risk analysis (CBD) ¹⁴ is shown to be potentially injurious to plants

³ The CBD definition emphasizes the physical presence of individuals of a species at a certain time, whereas the IPPC concept of occurrence relates to the geographical distribution of the taxon in general.

⁴ For CBD purposes, an alien species is already present in the **area** that is not within its native distribution (see **Introduction** below). The IPPC is more concerned with organisms that are not yet present in the area of concern (i.e. quarantine pests). The term "alien" is not appropriate for them, and terms such as "exotic", "non-indigenous" or "non-native" have been used in ISPMs. To avoid confusion, it would be preferable to use only one of these terms, in which case "non-indigenous" would be suitable, especially as it can accompany its opposite "indigenous". "Exotic" is not suitable because it presents translation problems.

⁵ A species that is non-indigenous and has entered an **area** through natural means is not an **alien species** (**CBD**). It is simply extending its natural range. For **IPPC** purposes, such a species could still be considered as a potential **quarantine pest**.

⁶ The CBD definition suggests that **introduction** (**CBD**) oncerns an **alien species** (**CBD**), and thus a species that has already entered the arc. He ever, it may e supposed, on the basis of other documents made available by CBD, that this is not o, and that a no indigenous species entering for the first time is being **introduced** (**CBD**). For CBD, a species **introduced** (**CBD**) many times, but for IPPC a species, once established, capacity be **introduced** again.

⁷ The issue of "areas bey and national partial tion" is not relevant for the IPPC.

⁸ In the case of indir at, it is not specifically stated in the definition whether all the movements mover must baintroductions (CBD) (i.e. by human agency, intentional or from one area to a be by natural movement. This question arises, for example, where unintentional a species is to one **area** and then moves naturally to an adjoining **area**. It seems ntrod ay be co that this sidered as an indirect introduction (CBD), so that the species concerned is an alien ang area, despite the fact that it **entered** it naturally. In the IPPC context, the species (C intermediate untry, from which the natural movement occurs, has no obligation to act to limit the natural moveme though it may have obligations to prevent intentional or unintentional introduction (CBD) if the importing country concerned establishes corresponding phytosanitary measures.

Notes:

- ⁹ The word "threaten" does not have an immediate equivalent in IPPC language. The IPPC definition of a **pest** uses the term "injurious", while the definition of a **quarantine pest** refers to "economic importance". ISPM 11 makes it clear that **quarantine pests** may be "injurious" to **plants** directly, or indirectly (via other components of ecosystems), while Supplement 2 of the Glossary explains that "economic importance" depends on a harmful impact on crops, or on the environment, or on some other specific value (recreation, tourism, aesthetics).
- ¹⁰ **Invasive alien species (CBD)** threaten "biological diversity". This is not an IPPC term, and the question arises whether it has a scope corresponding to that of the IPPC. "Biological diversity" would then have to be given a wide meaning, extending to the integrity of cultivated plants in agro-ecosystems, non-indigenous **plants** that have been imported and **planted** for forestry, amenity or habitat management, and indigenous **plants** in any **habitat**, whether "man-made" or not. The **IPPC** does protect **plants** in any of these situations, but it is not clear whether the scope of the above wide; some definitions of "biological diversity" take a much narrower view.
- ¹¹ On the basis of other documents made available by CBD, **invasive lien stress** may so threaten "ecosystems, habitats or species".
- ¹² The CBD definition and its explanation concern the whole to invalve alien species and do not address the term "invasive" as such.
- ¹³ The context of the IPPC is the protection of **plants**. It is clear that the are effects on biological diversity that do not concern **plants**, and so there are **frequency** solves (**CBD**) that are not relevant to the **IPPC**. The IPPC is also concerned with **plant product** but it is not clear to what extent the CBD considers **plant products** as a component of bit and diversity.
- ¹⁴ For the IPPC, organisms that have never entered the **ndangered area** can also be considered as potentially injurious to **plants**, as a result of **best risk and rsis**.

3.4 "Establishment"

CBD definition	Explanation in IPPC context
The process ¹⁵ of an alice species in a new poitat successfully produce g viable offspring ¹⁶ with a likelihood of continued success	The establishment of an alien species (CBD) in a habitat in the area it has entered , by successful reproduction

Notes:

- 15 **Estable ament (BD)** is a process, not a result. It seems that a single generation of reproduction can be **estable medically** provided the offspring have a likelihood of continued survival (otherwise there would be a comma after "offspring"). The CBD definition does not express the **IPPC** concept of "perpetuation to the foreseeable future".
- ¹⁶ It is not clear how far "offspring" applies to organisms that propagate themselves vegetatively (many **plants**, most fungi, other micro-organisms). By using "perpetuation", the **IPPC** avoids the question of reproduction or replication of individuals altogether. It is the species as a whole that survives. Even the growth of long-lived individuals to maturity could be considered to be perpetuation for the foreseeable future (e.g. plantations of a non-indigenous **plant**).

3.5 "Intentional introduction"

CBD definition	Explanation in IPPC context
· ·	Deliberate movement of a non-indigenous species into an area , including its release into the environment ¹⁸

Notes:

3.6 "Unintentional introduction"

CBD definition	Explanation in IPPC contex
All other introductions which are not intentional	Entry of a non-itangenous spector and a traded consignment, which it is ests or contaminates, or by some other human gency including pathways such as passengers traggast vehicles, artificial waterways

Notes:

3.7 "Risk analysis"

CBD definition	aplanation in IPPC context
1) the assessment of the consequences of the introduction and of the like so of establishment of an even species using scrence-based information the risk assessment), and 2) the identification to establish at can be implemented as reduce or manage these risks (i.e., risk management), using into account socio-commical deultural considerations ²¹	probability of establishment and spread , within an area ²³ , of an alien species (CBD) that has

Notes:

¹⁷ The "and/or" of the CBD definition is difficult to understand.

¹⁸ Under most phytosanitary import regulatory systems the intentional introduction of regulated pests is prohibited.

¹⁹ The prevention of unintentional introduction a regulatory systems.

²⁰ It is not clear wat kinds of consequences are considered.

²¹ It is not clear at what stages in the process of **risk analysis (CBD)** socio-economic and cultural considerations are taken into account (during assessment, or during management, or both). No explanation can be offered in relation to ISPM 11 or Supplement 2 of ISPM 5.

²² This explanation is based on the IPPC definitions of **pest risk assessment** and **pest risk management**, rather than on that of **pest risk analysis**.

²³ It is unclear whether **risk analysis (CBD)** may be conducted prior to **entry**, in which case the probability of **introduction** may also need to be assessed, and measures evaluated and selected to reduce the risk of **introduction**. It may be supposed (on the basis of other documents made available by CBD) that **risk analysis (CBD)** can identify measures restricting further introductions, in which case it relates more closely to **pest risk analysis**.

4. Other concepts

The CBD does not propose definitions of other terms, but does use a number of concepts that do not seem to be considered in the same light by the IPPC and the CBD, or are not distinguished by the IPPC. These include:

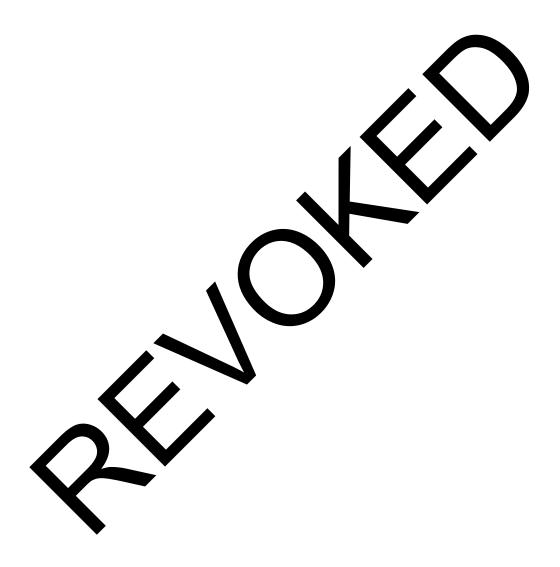

- border controls
- quarantine measures
- burden of proof
- natural range or distribution
- precautionary approach
- provisional measures
- control
- statutory measures
- regulatory measures
- social impact
- economic impact.
