2021 FIRST CONSULTATION

1 July - 30 September 2021

Compiled comments for Draft PT: Irradiation treatment for Pseudococcus jackbeardsleyi (2017-027)

Summary

Name	Summary			
ΕΡΡΟ Σ	Comments from the EPPO countries			
European Union	The comments on this draft standard have been entered into the OCS by the European Commission on behalf of the EU and its member States.			
Singapore	Singapore is supportive of this draft.			
South Africa	The NPPOZA is in agreement with this draft and has no further comments			
Venezuela	No tenemos observación alguna, sobre la norma

			1. The paper by Zhan et al. 2016 provides compelling data
			of large-scale confirmatory tests in potato and pumpkin that F1
			generation second instar nymphs emergence may be prevented
			from P. jackbeardsleyi females irradiated with a minimum dose o
			166 Gy. The DUR ranged from 1.19 to 1.25 in the three
			confirmatory tests. This appears acceptable. However, the report
			lacks some details about the health of the insect colony.
			a. The mealybug colony was originally established in 2012
			and reared on sprouting potato under laboratory conditions. Was the colony replenished or replaced on an annual basis with wild
			individuals? Were pest populations collected from other
			geographical regions? The experiments appear to be based on or
			pest collection. Experimental colonies are more robust when they
			include insects from a wide range of geographical regions. This w
			result in a colony that is more diverse genetically and more
			representative of a wider range of tolerances and adaptations.
			b. It would be helpful to have some information on the
			survivorship of the colony at each developmental stage and
			fecundity of the organisms in the colony, although some
			information can be deduced from Table 2 of Zhan et al. 2016.
			More than 98% of the F1 generation developed into second insta
			in controls in the three experiments, suggesting a healthy colony
			Information on whether the infestation rate used in the
			experiments was not excessive (i.e., no overcrowding resulting in
			the breakdown of the host commodity) would be helpful. For
			example, the rate of infestation was almost three times higher in potato than in pumpkin, which is a larger commodity than potato
			although the paper does not state which pumpkin species
			specifically was used in the experiments. (Line 41 of the Draft
			ANNEX TO ISPM 28: Irradiation treatment for Pseudococcus
			jackbeardsleyi-2017-027 indicates that Curcubita pepo was used
			in the Zhan et al. study. However, the paper only states Cucurbit
			sp.)
			c. We note that the large-scale experiment in potato was
			only conducted once, while two replicates at different times were
			conducted on pumpkin. A minimum of four replicates in each of
			the host commodity performed over a period of time to maximize
			natural variation in response within the experimental units is
			recommended.
			d. Another concern is that P. jackbeardsleyi is a host on a

				number of economically important commodity, including banana, rambutan, durian and pineapple, that is traded internationally. While the data presented on potato and pumpkin by Zhan et al. look promising, it appears premature to recommend a minimum dose of 166 Gy for phytosanitary treatment of P. jackbearsleyi infestation in any host commodity. A generic dose should be supported by data on a range of species that adequately represents major quarantine pests within the taxa, with large-scale confirmatory trials being conducted. Information on the condition of the commodity at the time of the study should also be provided. 2. The report by Zhan et al. 2016 cites Shao et al. 2013, which determined the most radiation-tolerant state of P. jackbeardsleyi to be the late female stage, which was used in the experiments by Zhan et al. Unfortunately, only the abstract of the Shao et al. paper is in English. Therefore, it is difficult to ascertain the methodology details of the dose-response testing that determined the most radio-tolerant developmental stage. For example, how many individuals of each life stage were tested? How many replicates were performed? How was the mealybug colony reared and were the most-tolerant stage experiments also conducted on P. jackbeardsleyi-infested potato or pumpkin? 3. Hofmeyr et al. 2016 reported that P. jackbeardsleyi ovipositing females were not sterilized at 200 Gy, but produced fertile eggs that eclosed into non-viable F1 first instars, supporting observations reported by Zhan et al. 2016. However, the paper lacks some details regarding the: a. Health, origin, maintenance of the P. jackbeardsleyi colony; b. Specific rate of infestation of pumpkins and potatoes (only a range of 30-100 is provided); c. Dosimetry and DUR; d. Determination of how the most radio-tolerant stage was determined in the various mealybug species tested, even though
				determined in the various mealybug species tested, even though Hofmeyr et al. 2016 confirmed that the most radio-tolerant stage for treatment validation was ovipositing P. jackbeardsleyi females. Category: SUBSTANTIVE

22	26	This treatment describes the irradiation of fruits, vegetables and ornamental plants at 166 Gy minimum absorbed dose to prevent development of to the second-instar nymphs from mature adult females nymph stage of progeny from Pseudococcus jackbeardsleyi at the stated efficacy.	Р	European Union Easier to understand - Consistency with paragraphs 35, 36 and 42. Category: EDITORIAL
23	26	This treatment describes the irradiation of fruits, vegetables and ornamental plants at 166 Gy minimum absorbed dose to prevent development of to the second-instar nymphs from mature adult females nymph stage of progeny from Pseudococcus jackbeardsleyi at the stated efficacy.	Р	EPPO Easier to understand? Consistency with paragraphs 35, 36 and 42. Category: EDITORIAL
Treatment				
24	36	There is 95% confidence that the treatment according to this schedule prevents offspring developing to the second-instar nymph stage from not less than 99.9964%—9982% of mature adult females of <i>Pseudococcus jackbeardsleyi</i> .	P	China According to the research reported by Zhan et al. (2016) "No F 1 generation 2nd instar nymph emerged from an estimated 118,520 late females reared on potato, or 49,290 late females reared on pumpkin" Category: SUBSTANTIVE

25	38	This treatment should not be applied to <u>fruitfruits</u> , vegetables or ornamental plants stored in modified atmospheres because modified atmosphere may affect the treatment efficacy.	P	China Pseudococcus jackbeardsleyi has a variety of host fruits Category : EDITORIAL
Other releva	ant info	rmation		
26	40	Because irradiation may not result in outright mortality, inspectors may encounter live but non-viable <i>Pseudococcus jackbeardsleyi</i> eggs, nymphs and adults during the inspection process. This does not <u>necessarily</u> imply a failure of the treatment.	P	New Zealand Live larvae may survive from a treatment failure or other unknown circumstances. Category: SUBSTANTIVE
27	40	Puesto que la irradiación podrá no ocasionar la muerte inmediatamente, los inspectores podrán encontrar huevos, ninfas y adultos de <i>Pseudococcus jackbeardsleyi</i> vivos, aunque no viables, durante el proceso de inspección. Esto no implica que el tratamiento sea ineficaz.	С	En texto: "Puesto que la irradiación podrá no ocasionar la muerte inmediatamente, los inspectores podrán encontrar huevos, ninfas y adultos de Pseudococcus jackbeardsleyi vivos, aunque no viables, durante el proceso de inspección. Esto no implica que el tratamiento sea ineficaz." Se deberían incluir las alternativas a seguir para definir claramente cuando fue o no eficaz el tratamiento. Se da por entendido que los insectos vivos de Pseudococcus son no viables, pero habría que evaluarse esta condición para confirmarlo o desmentirlo. En caso que se hallen plagas vivas, la ONPF tendría que considerar tomar un tratamiento de emergencia e iniciar la evaluación de la viabilidad de las plagas encontradas vivas No es claro cuál sería la referencia para evaluar la eficacia o no del tratamiento por parte de los inspectores. Lo que se podría prestar para interpretaciones erróneas en el resultado final del tratamiento. Category: SUBSTANTIVE
28	41	The Technical Panel on Phytosanitary Treatments (TPPT) based its evaluation of this treatment on the research reported by Zhan <i>et al.</i> (2016), which determined the efficacy of irradiation as a treatment for this pest on potato (<i>Solanum tuberosum</i>) and pumpkin (<i>Cucurbita pepo</i>). The TPPT also considered information on the effect of irradiation on <i>Pseudococcus jackbearsleyi</i> in HofmeyrShao et al. (2013) and Hofmeyr et al. (2016). <i>et al.</i> (2016) and Shao <i>et al.</i> (2013).	P	China Reference literature should be arranged in chronological order Category: SUBSTANTIVE
29	42	The efficacy of this schedule was calculated based on a total of 83,905 mature adult females treated preventing offspring developing to the second instar nymph stage; in the <u>control_control</u> , development of offspring from neonates was 98.0%.	P	European Union A comma added for ease of reading. Category: EDITORIAL
