

Fig. 45. Egg, first, second, and third instars of [*Dacus bivittatus*] showing differences in sizes.

Fig. 46. Cephaloskeleton of *Ceratitis fasciventris*, third instar. Subapical tooth on mouthhook is much smaller than apical tooth. Dental sclerite present (arrow). Bar = length of cephaloskeleton.

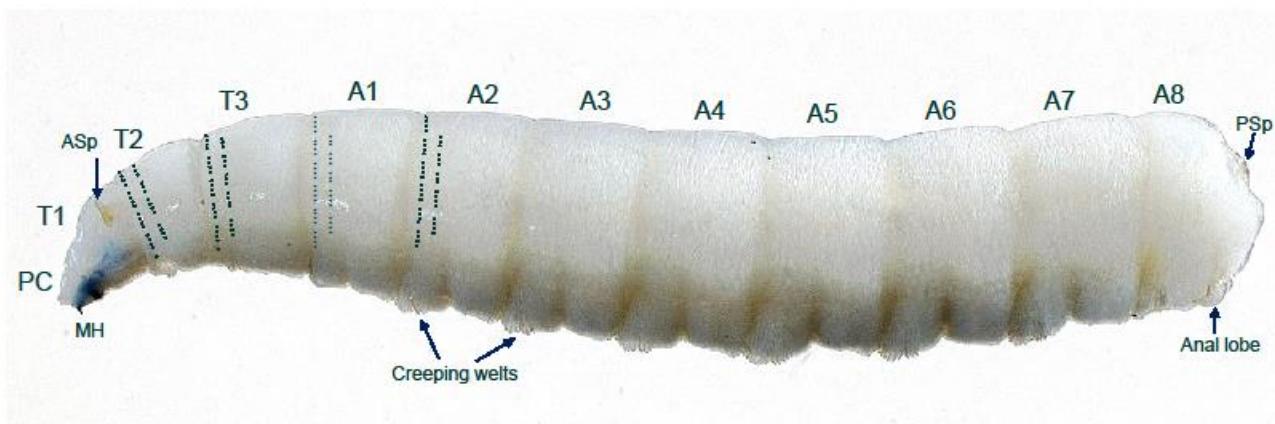

Fig. 47. Cephaloskeleton of *Ceratitis fasciventris*, second instar. Subapical tooth on mouthhook is subequal in size to apical tooth.

Fig. 48. Slide-mounted, cleared cuticle with cephaloskeleton removed.

## Third Instar Larva

- Cylindrical, tapered anteriorly, body usually white or yellow
- Pseudocephalon much reduced; cephaloskeleton internal except for exposed mouthhooks
- Thorax – 3 segments
- Abdomen – 8 segments
- Abdomen and thorax with ventral "creeping welts" which comprise bands of spinules (sometimes continuing dorsally)

PC – pseudocephalon (head, cephalic segment)  
T1-T3 – thoracic segments  
A1-A8 – abdominal segments  
ASp – anterior spiracle  
PSp – posterior spiracle  
MH – mouthhook
