Vapour heat-modified atmosphere treatment for Cydia pomonella and Grapholita molesta on Malus pumila and Prunus persica

This page is intentionally left blank

ISPM 28 Phytosanitary treatments for regulated pests

PT 44: Vapour heat-modified atmosphere treatment for *Cydia pomonella* and *Grapholita molesta* on *Malus pumila* and *Prunus persica*

Adopted 2022; published 2022

Scope of the treatment

This treatment describes the vapour heat treatment under modified atmosphere of fruit of *Malus pumila* and *Prunus persica* to result in the mortality of eggs and larvae of *Cydia pomonella* and *Grapholita molesta* at the stated efficacy.¹

Treatment description

Name of treatment Vapour heat–modified atmosphere treatment for Cydia pomonella and

Grapholita molesta on Malus pumila and Prunus persica

Active ingredient n/a

Treatment type Physical (vapour heat) and modified atmosphere

Target pests Cydia pomonella (Linnaeus, 1758) (Lepidoptera: Tortricidae) and

Grapholita molesta (Busck, 1916) (Lepidoptera: Tortricidae)

Target regulated articles Fruit of *Malus pumila* (apple) and *Prunus persica* (peach and nectarine)

Treatment schedule

Exposure of fruit in a vapour heat and modified atmosphere chamber:

- with air temperature held at 45 °C or above;
- in a normal atmosphere with the concentration of oxygen (O_2) reduced to 1% or below, the concentration of carbon dioxide (CO_2) raised to 15% \pm 1%, and the balance maintained with added nitrogen (N_2) ;
- to reach a fruit core temperature of 44.5 °C or above within not more than 2.5 hours;
- to maintain a fruit core temperature of 44.5 °C or above and relative humidity of 90% or above for at least 30 continuous minutes;
- to heat the fruit for at least three hours in total.

¹ The scope of phytosanitary treatments does not include issues related to pesticide registration or other domestic requirements for contracting parties' approval of treatments. Treatments adopted by the Commission on Phytosanitary Measures may not provide information on specific effects on human health or food safety, which should be addressed using domestic procedures before contracting parties approve a treatment. In addition, potential effects of treatments on product quality are considered for some host commodities before their international adoption. However, evaluation of any effects of a treatment on the quality of commodities may require additional consideration. There is no obligation for a contracting party to approve, register or adopt the treatments for use in its territory.

There is 95% confidence that the treatment according to this schedule kills not less than 99.9884% of eggs and larvae of *Cydia pomonella* and *Grapholita molesta*.

Other relevant information

The Technical Panel on Phytosanitary Treatments (TPPT) based its evaluation of this treatment on the research reported by Neven, Rehfield-Ray and Obenland (2006), which determined the efficacy of vapour heat and modified atmosphere on *Cydia pomonella* and *Grapholita molesta* in peaches and nectarines, and Neven and Rehfield-Ray (2006), which determined the efficacy of vapour heat and modified atmosphere on *Cydia pomonella* and *Grapholita molesta* in apples using a heating rate of 12 °C/hour. The TPPT also considered information on the effect of vapour heat and modified atmosphere on *Cydia pomonella* in Neven and Hansen (2010), Neven, Lehrman and Hansen (2014), Yokoyama and Miller (1987) and Yokoyama, Miller and Dowell (1991).

The efficacy of this schedule was calculated based on a total of 25 882 fourth- and fifth-instar larvae of *Cydia pomonella* treated with no survivors; the control survival was 89.6%.

The air humidity is lower at the beginning of the treatment to prevent condensation on the fruit and hence maintain fruit quality. To minimize effects on commodity quality, users should refer to Neven and Rehfield-Ray (2006) and Neven, Rehfield-Ray and Obenland (2006).

Publication history last updated: 2022-04

IPPC

The International Plant Protection Convention (IPPC) is an international plant health agreement that aims to protect global plant resources and facilitate safe trade.

The IPPC vision is that all countries have the capacity to implement harmonized measures to prevent pest introductions and spread, and minimize the impacts of pests on food security, trade, economic growth, and the environment.

Organization

- There are over 180 IPPC contracting parties.
- Each contracting party has a national plant protection organization (NPPO) and an Official IPPC contact point.
- 10 regional plant protection organizations (RPPOs) have been established to coordinate NPPOs in various regions of the world.
- The IPPC Secretariat liaises with relevant international organizations to help build regional and national capacities.
- The Secretariat is provided by the Food and Agriculture Organization of the United Nations (FAO).
