

The following themes will be presented
and discussed during the workshop:

- * Review of existing phytosanitary measures (including legislation, regulation and official procedures)
- * Scientific and technical needs of National Plant Protection Organizations
- * Delivery capacity of National Plant Protection Organizations (inspections, detection, pest-free areas, eradication, containment, etc.)
- * Information access and sharing**

27th NAPPO Annual Meeting

October 20-24, 2003

For complete information please visit:

www.aphis.usda.gov/ppq/nappo

MISSION

NAPPO, a Regional Plant Protection Organization of the International Plant Protection Convention, coordinates the efforts among Canada, the United States and Mexico to protect their plant resources from the entry, establishment and spread of regulated plant pests, while facilitating intra/interregional trade.

A screenshot of a Netscape browser window displaying the official website of the North American Plant Protection Organization (NAPPO). The title bar reads "Officers-e - Netscape". The menu bar includes File, Edit, View, Go, Bookmarks, Tools, Window, and Help. The toolbar features standard icons for back, forward, search, and file operations. The address bar shows "file:///A:/Officers-e.htm". The page header features the NAPPO logo, which consists of a stylized green leaf inside a red, blue, and green arch, with the acronym "NAPPO" in blue letters below it. To the right of the logo, the text "ORGANISATION NORD AMERICAINE POUR LA PROTECTION DES PLANTES", "NORTH AMERICAN PLANT PROTECTION ORGANIZATION", and "ORGANIZACION NORTEAMERICANA DE PROTECCION A LAS PLANTAS" is displayed in red, black, and green respectively. Below this, "CANADA", "UNITED STATES", and "MEXICO" are listed. The main content area is organized into four sections: "NAPPO SECRETARIAT" (with links to "EXECUTIVE COMMITTEE" and "WORKING GROUP"), "PANELS" (with links to various panels like FRUIT, GRAINS, etc.), and "NAPPO SECRETARIAT" (with a table of staff members). The bottom of the page includes a "Back to index" link and a standard browser footer.

Cerambycidae larvae and Limacodidae pupa (Asian wood borers and slug caterpillar)

Canadian Pest Interceptions on Korean Bonsai Trees

IDENTITY

Name: Cerambycidae larvae and Limacodidae pupa
(Asian wood borers and slug caterpillar)

Click here for the enlargement of
this photo or for additional images

Taxonomic Position:

Animalia : Arthropoda : Insecta:

Significance:

On March 28, 2003 the Canadian Food Inspection Agency found severe insect damage on bonsai trees originating in Korea during a routine import inspection. The inspector found evidence of multiple quarantine-significant pests.

Issues of Concern: The movement of pests via bonsai plants is a recognized pathway for the introduction of exotic longhorned beetles. The affected host genera in this interception included *Acer*, *Carpinus* and *Juniperus*. The shipment also contained *Rhododendron* and *Ilex* species that appeared to be unaffected. On the *Acer* and *Carpinus* plants large tunnels and exit holes similar to those caused by *Anoplophora* spp. (Cerambycidae) were found. Some of the tunnels contained excelsior and in one case a larval head capsule was recovered. On the *Juniperus* plants, tunnels resembling those caused by *Callidiellum* were found. *Callidiellum rufipenne* (Cerambycidae) is an Asian wood borer frequently intercepted species in wood packaging and dunnage materials. On one of the plants a viable pupa belonging to the family Limacodidae (Lepidoptera) was collected. Larvae of the species in this family are commonly known as slug caterpillars due to their ornamentation. Some species have spines that can produce a painful sting. Limacodid larvae are foliage feeders on a wide variety of deciduous trees and shrubs. Most species

News Stories

Recent news stories concerning pest outbreaks

Warning: The following pest reports have not yet been confirmed with the appropriate National Plant Protection Organization. They are provided solely as an early warning to NAPPO countries, and all National and Regional Plant Protection Organizations should use this information with caution.

Subject : Causal agent and vector determined for Cucurbit yellow vine disease (CYVD)

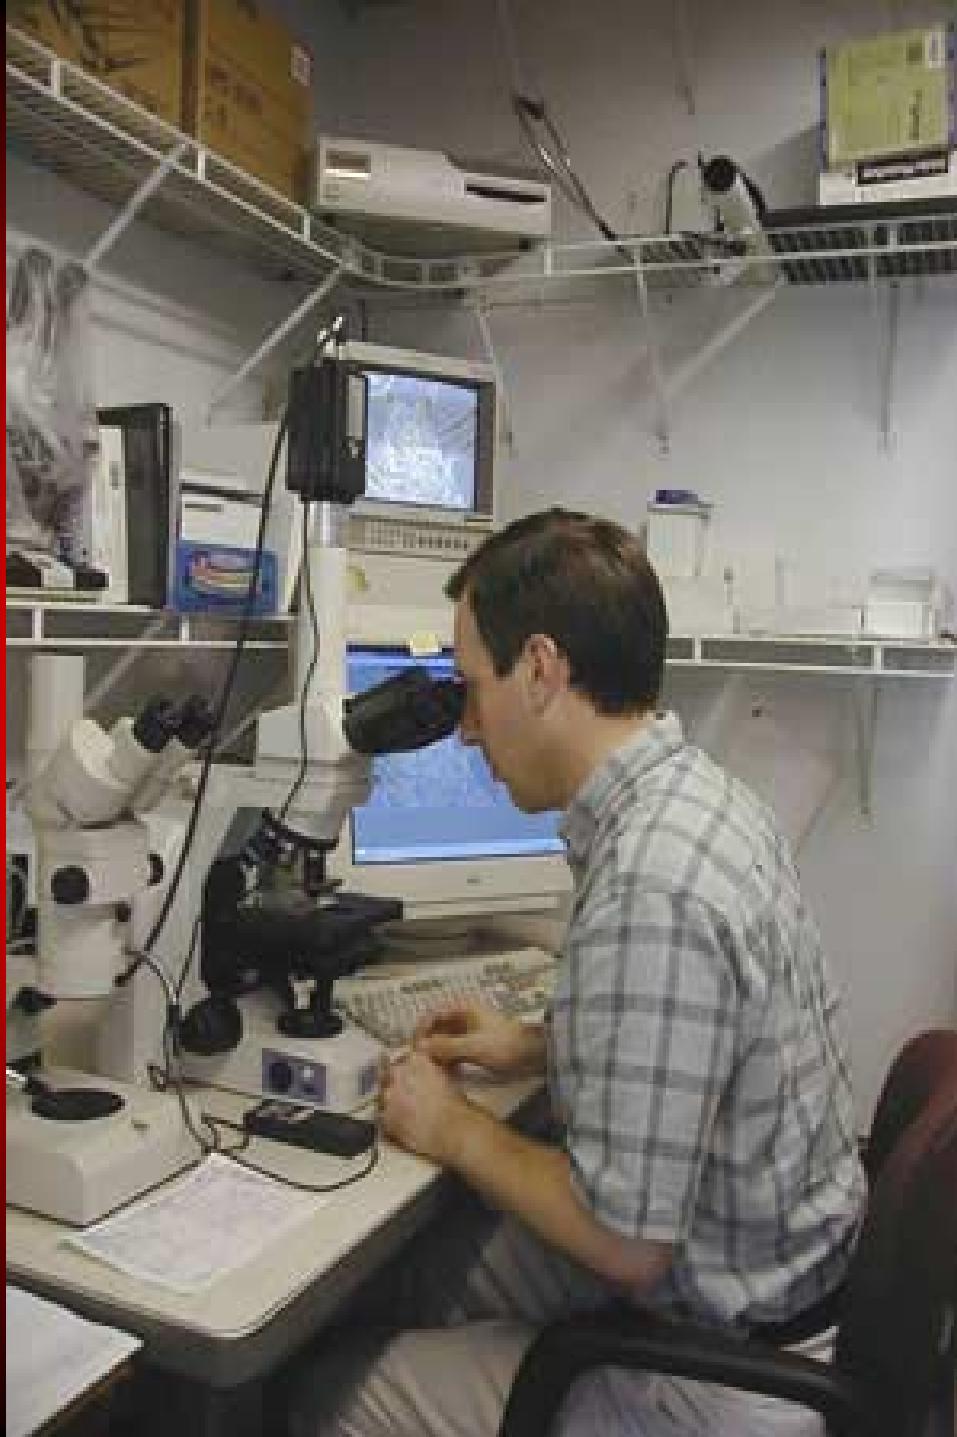

Date posted: 08/08/03

Source : Promed

News : Bacteria were cultured from the phloem of *Citrullus lanatus* (watermelon) and *Cucurbita pepo* (field pumpkin) plants displaying symptoms of Cucurbit yellow vine disease (CYVD). Bacteria that tested positive in a CYVD-specific polymerase chain reaction (PCR) were gram-negative, morphologically identical, and characterized as *Serratia marcescens*. Greenhouse and field grown squash plants were inoculated with *S. marcescens* by puncture inoculation and enclosure with *S. marcescens*-fed squash bugs (*Anasa tristis*) respectively. Sixty-percent of the greenhouse-grown and 17% of the field-grown plants developed symptoms of, and tested positive for, *S. marcescens*. This study confirms *S. marcescens* is the causal agent of CYVD and *A. tristis* is the vector.

Cucurbit yellow vine disease (CYVD) is found in production areas from the Midwestern to the Northeastern United States and can cause heavy losses to watermelon, pumpkin, cantaloupe, and squash. Symptoms of CYVD are phloem discoloration, foliar yellowing, wilting, and plant decline.

FAST Data Search in the Agricultural Internet Monitoring System

Presenter: USDA APHIS NCSU

Forum: August 22, 2003

Pest Reporting: ISPM No. 17

- Adopted March 2002
- Pests of immediate or potential danger
- Occurrence, outbreak, spread
- Pest status
- Not for routine pest management data

Scope

- Pests of immediate or potential danger
- Occurrence, outbreak, spread
- Pest status
- Not for routine pest management data

Pest Reporting Involves:

Surveillance (ISPM 6)

Pest Status (ISPM 8)

Pest Risk Analysis (ISPM 2, 11)

Pest Free Areas (ISPM 4)

Pest Eradication (ISPM 9)

Working Group on Pest Reporting

Sept. 5-8, 2000 Ljubljana

Robert Griffin (IPPC)
John Hedley (ICPM)
Ian Smith (EPPO)
Daniel Fieselmann (USA)
Datarina Groznik (Slovenia)

Pest Reporting: NAPPO Decision Sheet

NAPPO Executive Committee Decision Sheet

Issue:

Compliance by North American Plant Protection Organization (NAPPO) countries (Canada, the United States and Mexico) with International Plant Protection Convention (IPPC, 1997) pest reporting obligations.

Background:

The IPPC requires countries to report on the occurrence, outbreak, and spread of pests with the purpose of communicating immediate or potential danger. These obligations form the basis of International Standard for Phytosanitary Measures (ISPM) No. 17, *Pest reporting*. National Plant Protection Organizations (NPPOs) have the responsibility to collect pest information by surveillance and to verify the pest records thus collected. Occurrence, outbreak or spread of pests that are known to be of immediate or potential danger should be reported to neighboring countries and trading partners.

As signatories to the IPPC, each NAPPO country has agreed to its obligations. Compliance with these obligations will be achieved through the direct posting of Official Pest Reports, or links to Official Pest Reports that are hosted on the country's own website, on the NAPPO Phytosanitary Alert System website (www.pestalert.org). Each NAPPO country will be responsible for establishing its own internal approval procedure for preparing Official Pest Reports. To facilitate posting, the NAPPO Pest Alert web site provides each country with secure access for posting new Pest Reports and editing or deleting existing Pest Reports, and a system for notifying individual official IPPC contact points, as determined by the reporting country, of newly posted reports. NAPPO countries may adopt their own procedure for notifying individual NPPOs of new pest reports posted on the Phytosanitary Alert System website.

Decision:

NAPPO countries agree to use the Phytosanitary Alert System website as a mechanism of compliance with IPPC pest reporting obligations.

Official Pest Reports :United States

Official Pest Reports are provided by National Plant Protection Organizations within the NAPPO region. These Pest Reports are intended to comply with the International Plant Protection Convention's [Standard on Pest Reporting](#), endorsed by the Interim Commission on Phytosanitary Measures in March 2002.

Detection of *Scolytus schevyrewi* Semenov in Colorado and Utah - 07/15/2003

On May 13, 2003, the Agricultural Research Service, Systematic Entomology Lab confirmed that specimens of *Scolytus schevyrewi* Semenov (*S. schevyrewi*), an exotic scolytid previously unknown in the United States, had been collected in Colorado and Utah. Between April 1 and May 9, 2003, *S. schevyrewi* was collected near two Colorado solid wood packing material recyclers (3 specimens from one site and 67 from another) at the Denver Zoo (two specimens) and from sites in Ogden, Logan, Clearfield, and Smithfield, Utah (13 specimens). Since early May, the APHIS/Forest Service Rapid Detection and Response Pilot Project team in coordination with State officials continue to discover *S. schevyrewi* in Colorado and Utah. To date, this species has not been reported from other States.

Hosts of *S. schevyrewi* include *Elaeagnus* spp. (Russian olive), *Salix* spp. (willow), *Ulmus* spp. (elm), *Caragana* spp. (peashrub), and *Prunus* spp. Research from Asia indicates that *S. schevyrewi* does not colonize and breed successfully in healthy elms; the beetle attacks trees that have been weakened and predisposed to attack by drought, severe defoliation or pathogen invasion. *Scolytus schevyrewi* may produce several generations per year. The potential for *S. schevyrewi* to vector exotic pathogens is currently unknown and is a possible concern. The known distribution of *S. schevyrewi* outside the United States is Russia and Mongolia and central, northwestern, northern, northeastern and eastern China and Korea.

Allium triquetrum [Photo: sm med lg]

A tall, late Winter, early Spring bloomer with white, pendulous, Lily like, almost Galanthus like flowers with green stripes on 12-18" stems . A very vigorous grower to say the least.

Allium virguncula splendens [Photo: sm med lg]

Dynamite dwarf plant from Japan. Double purple flowers on a 3-6" fine textured plant in September and October. Useful in the front of the border to provide color when everything else is turning brown.

Alstroemeria psittacina [Photo: sm med lg]

From the mountains of Brazil comes this hardy species of one of the most popular cut flowers ever grown. I've grown it in my zone 5 garden for over 10 years now, and its made a lovely colony of light green foliage about 8-12" tall. In early Summer it starts its long period of bloom, producing volumes of reddish, slightly upfacing, trumpet like flowers spotted with green and brown.

Anemone ranunculoides [Photo: sm med lg]

Bright yellow Buttercup flowers over foliage reminiscent of ferns in the genus Botrychium. Blooms in early Spring. I don't have much experience with this cool little plant yet, but it seems hardy, vigorous and easy.

Anemonella thalictroides [Photo: sm med lg]

One of my favorite little plants in my favorite family, Ranunculaceae. This is
